

NOOBS 2.8.1: Raspberry Pi Setup Made Easy

Raspberry Pi is a single-board computer popular among do-it-yourself (DIY) experts. Be it for electronics-based projects or for home use, Raspberry Pi finds a special place. While regular users are well-aware of its various advantages, new users find comfort in its compact and easy-to-use interface to get the hang of it. For that purpose, Raspberry Pi Foundation has come up with New Out Of the Box Software (NOOBS), an operating system (OS) installer for Raspberry Pi to get beginners aboard.

NOOBS is an easy, plug-and-play-type software that helps set up a Raspberry Pi computer with the necessary operating platforms in the simplest way possible. The setup is guided by easy-to-understand instructions. It does not require any network or other imaging software for installing an OS on Raspberry Pi.

Features in version 2.8.1

NOOBS provides a variety of software platforms (both system OSes and media centre platforms) for Raspberry system. Raspbian is the default OS available in NOOBS. Other options include (but are not limited to) OpenELEC, LibreELEC, OSMC, Windows 10 IoT Core, RISC OS, TLXOS, Recalbox, Lakka and so on. While Raspbian can be downloaded without Internet connectivity, others may require it. NOOBS repository keeps the most updated version of all software.

The latest version of NOOBS brings a compact user interface with all functionalities easily visible on the first screen itself.

You can access the following options while operating NOOBS.

Install. This option lets you install the desired OS provided by NOOBS. Check the programs you want to install and click on Install on the interface. NOOBS will take care of the rest!

Edit config. NOOBS allows you to edit or customise .config files of the OS installed in Raspberry Pi. Editing is done in the form of a text editor interface.

Wi-Fi networks. This option guides you in terms of the connec-
