

cation that you can install on the RPi to allow it to serve web pages. Apache can serve HTML files over HTTP, and with additional modules it can serve dynamic web pages using scripting languages such as PHP. First install the Apache package by typing the following command in the Terminal:

**Sudo apt-get install apache2 -y**

By default, Apache puts a test HTML file in the web folder. This default web page is served when you browse <http://192.168.1.98> from another computer on the network. Browse the default web page either on the RPi or from another computer on

the network; you would see the default page. Next, install PHP5 by giving the following command in the Terminal:

**Sudo apt-get install php5**

### RPi cam web interface

The RPi is connected to the Ethernet and configured to access the Internet. It is then made to connect to the LAN via Wi-Fi. Then an RPi camera module is connected to Board1. Still images are

captured and the result is checked in the RPi cam web interface page of the Raspberry Pi. The same configurations are done to get video transmission. Installation of RPi Cam Web Interface is shown in Fig. 12, final web page in Fig. 13 and camera setting in Fig. 14.

The final set up of video transmission is done by installing DualScreen app in your smartphone that is placed in the VR headset. This is done to increase the effect of the VR experience.

**Python.** Python is a widely used high-level programming language for general-purpose programming. Python programs don't need to be compiled before running them. However, the Python interpreter must be installed on the computer to run them. The Python interpreter is a program that reads Python files and executes the code. The `python_camera.py` code is used in the RPi board to control the servo motors.

**Arduino IDE.** The open source Arduino software (IDE) makes it easy to write code and upload it to the board. It runs on Windows, Mac OS X and Linux. The environment is written in Java and
