

the following functions:

1. The SDR dongle can make Android tablet/phone compatible for FM signal reception and listening to FM broadcasts, which is helpful for devices without FM option.

2. The SDR implemented using

Android smartphone and RTL-SDR can receive FM broadcast channels.

3. The amplitude modulation (AM) signal can be demodulated using the setup between the supported frequency ranges.

4. The SDR system can be used to

get Radio Data System (RDS) values of FM broadcast signals.

5. The FM signal spectrum can be viewed using the Android app.

6. Troubleshooting guide is provided in the SDRTouch app for using the Android SDR system.
