

THE BEST AIR PURIFIER FOR YOUR HOME

Air pollution has been a longstanding concern in Indian cities. Yet, a substantial number of households don't use air purifiers. The choice of the right air purifier might be hindered due to insufficient information. Therefore in this article, we help you identify all the must-have features in an air purifier, and explore some of the best market options available in the market

Nidhi Arora

The function of an air purifier is to pass the air through its filter, trapping the dust and particulate matter while releasing clean air. The filter material and the cleansing channels may vary from device to device. But the functional basics remain the same. Alongside the filter, there are many other important parameters to look for in an air purifier. These are detailed below.

Pre-filter. Without a pre-filter, the main filter of the air purifier will wear out much quickly. This decreases the effectiveness of the main filter over time. Moreover, pre-filter acts as an extra protection against contaminated air. Particulate matters in the scale of PM 2.5 and PM 10 are at large in India. Air purifiers with pre-filters thus become quite important.

HEPA filter. It is the most popular and efficient type of filter for air purifiers. It is used to cleanse out the

smallest of particles down to a size of 0.3 micron. Some purifiers come with an ultrafine particle filter with HEPA filters to cleanse particles smaller than 0.3 micron as well.

Activated carbon. Even if you take out the particulates and dusts, what about the odour? Activated carbon is a solution to that. These particles remove gaseous and chemical elements from the air, rendering it odour-free. Some purifiers contain activated carbon as mesh-like sheets, while others contain it as pellets.

Clean-air delivery rate (CADR). It indicates the volume of clean air produced by the purifier every minute. Air purifiers come with CADR ratings for smoke, dust and pollens each. The smoke and dust CADR readings have a
