

able. The material is antibacterial, ensuring safe and healthy usage.

The chip is Bluetooth-driven and can display data on your smartphone via Digitsole's smartphone application. The app is compatible with both Android and iOS as well as running and cycling profiles. Apart from the generic distance, time and speed measurement, it gives a 3-dimensional analysis of your running/cycling pattern, including strike or stroke nature, propulsion level, stability, pedalling power, pedalling angle, cadence and so on. It evaluates injury risks and fatigue levels and provides guidelines for optimal exercise.

The sole also has an inbuilt voice-driven assistant and a GPS tracker. Historical data is stored for compari-

son. The sole is powered by a lithium polymer battery, which runs up to a week on a single charge.

In the box, you get a microUSB cable along with the insoles. The insole is priced at 100 euros (about ₹ 8000).

Milestone's Pod clamps onto the shoe laces (source: milestonepod.com)

Milestone's Pod brings smart footwear in the most compact form factor possible. It works by simply clipping onto your shoe laces or borders. The holder is strong enough to make the pod stick to your footwear, no matter how much jerking or thrust is applied on it. It can differentiate automatically between walking and running as well as motion and rest.

So, as soon as you start moving, Milestone Pod starts recording data. It records walk as a legitimated session if at least 100 steps are taken.

This Bluetooth-driven device connects to the MileStone application on your mobile and records metrics like mileage covered, steps taken, leg swing pattern, foot strikes and stride length in real time. All the metrics can be compared in graphical views, thus providing useful insights. The battery is powerful enough to keep the device running for up to six months.

Milestone Pod costs \$25 (₹ 1500) onwards.

Sensoria Socks are pretty interesting. As evident, these are actual socks made of smart textile, that is, the fabric contains textile sensors to capture the different data generated by the foot during walking or running. To connect to the smartphone, you have to lock the cuff of the socks with a magnetic Bluetooth anklet.
