

Medical care

organisations to venture into this space. It has captured the largest market share with Roomba, which has been around for nearly 15 years. Now with competition covering this segment, we are starting to see robots for exclusive jobs like auto mapping, auto sewage cleaning and auto lawn mowing. Going forward, we could have a maid robot that can initiate and complete tasks.

3. Exploring the unexplored.

Many feel that robots will create a job vacuum for humans. But if we think differently to robotics and automation,

Household chores

Exploring the unexplored

we can give away the tough tasks to humanoids and open new franchisees

of work for ourselves. These can be in the fields of skill enhancement, AI development, robotics usage, exploring the unexplored in the fields of medical, training, education, entertainment, etc.

4. Security and armed forces.

A robot army can save many innocent lives at war. *Transformers* movie has already shown us the way, where it envisages a robo human army working together with specialised guns and latest artillery. But there are challenges to overcome: The mainframe that shall support this kind of army, that is, the Internet of Things (IIOT), is hackable. And if hackers are able to change the languages that support these mainframes, the army can turn rogue.

If robots can be programmed and firewalled well, these would be a great help to stop terrorism and infiltration across borders as we would have a 24-hour fatigue-free army manning our borders. **EFY**
