

are satisfied and you get to know if there is any scope for improvement. The click-to-action-enabled notifications make things a whole lot easier for the subscribers as they not only get reminded but are also aided in the decision-making process. The company also offers an after-sales feedback service that makes sure you know how you are doing.

Finally, they help you squeeze value out of your product through survey services and Ad-Network that they developed.

The technology behind Feedify (a widget and script that can be integrated with most popular platforms like Joomla, Wordpress, Blogger, Magento and Wix) works on push service, which enables you to push content to your subscribers. An opt-in request shown to the visitor gets her or him converted to a subscriber. This also comes with the added advantage of reaching the user even when she or he is not on your website. It also provides exit intent to reduce bounce rates and a feed forward mechanism that helps sort the feedback received and shoots alerts to specific departments, thereby automating the processes.

In a virtual world, it is hard to mimic the power of business-customer interaction that exists in the real world. History shows examples of many great companies that continued to thrive, sometimes even without offering anything special, just because they engaged better with their customers.

While Feedify does not guarantee the warmth of a human presence, it ensures that the customers and businesses are as close to each other as possible. With its product, no website suffers the downside of looking like just another page in a mighty big book. Every word interacts. Every tool helps you establish two-way communication that is so important for survival on the Web.

Feedify not only relies on great tech for its growth, but also pays attention to behavioural economics to make money. The company's growth strategy includes quickly adapting to new changes that market fluctuations and customer expectations bring with them, at the same time, paying attention to understanding customer behav-

iour and their needs to leverage growth.

Feedify team believes that the most essential aspect of growth is people. If they are successful to bring enough on customer's side of the dock, they will surely sell more. With this understanding, they introduced Ad-Network gateway that helps businesses reach more and more people and, at the same time, helps clients and the company make more money.

When the idea of a product that turns visitors into customers was being executed, the team faced hiccups in its vision of creating a world-class product. But it was sheer persistence and an insatiable appetite to succeed that helped them create a satisfactory product.

A CRM Tool To Help You Sell More In Less Time

Vyshakh Nair and Farooq A. Rahim identified the importance of resources a company allocates towards their sales team and the need to optimise the utilisation of those resources. They founded Deloz LLC as a sales automation platform for companies to organise their entire sales process, helping them build long-term quality relationships with their customers by remembering each and every detail of their interaction. They also guide organisations to make decisions backed by value-driven insights.

Nair shares how the absence of a reliable solution inspired them to build one themselves, "Before the advent of Deloz, we actually tried our hands on multiple other customer relationship management (CRM) tools for our other firms. It was a lot of effort and provided us with a few headaches here and there. We connected with many people and came to know that majority of the existing CRMs were developed a few years earlier and the current version is a result of older features stacked with the new

features in the new release.

"This resulted in an overloaded CRM that was cumbersome to use for new users. Also, such CRMs were not really intuitive for user applications. Therefore we decided to create Deloz, an intuitive sales automation platform for sales professionals, lauded with just enough features for the users to get optimum use out of her or his data and be a cakewalk in getting onboard with the product."

Team Deloz helps organisations build long-term quality relationships with their customers by remembering each and every detail of their interaction. How do they do that? By providing all user data in such effortless manner that following up on sales turns from headache to effortless fun. They also guide their clients to propel their business by making the right decisions.

They believe that any good product should just get better as you use it. Increase in sales and revenue, management of multiple revenue streams, unified communication, effective reporting and productivity boost are a few services Deloz inherently gives its users.

Sharing about Deloz's growth plans and challenges, Vyshakh adds, "As a Dubai-based startup, we had a hard time understanding the cultural differences in the Western market, but it is well settled now.

"The second challenge was to keep the team motivated to work on such a competitive sector and on a Kaizen project like this, and to continuously scale ourselves up to gain absolute clarity over the decisions taken and strategies applied in coherence with the forecast results. We needed a robust yet high-level programming language to prototype our application backend, which is object-oriented, scalable and reliable when it comes to CPU-intensive operations. Since we advocate open source technologies, we chose Python. Even after all this time, we never regretted our decision."

Keeping up with its commitment of delivering value, in April 2017, Deloz raised a Series A funding of US\$ 1 million. On February 15, 2018, they had a soft launch, and the team has acquired more than 700 customers since then, solely through organic and partnership channels. **EFY**
