**D**oes it ever happen to you at a store that, when a sales person explains the features of a product, you are unable to relate to any of the technical terms used. It happened with me when I recently visited a store to buy an air-cooler. I was amazed with so many multipurpose and automatic features. So, I decided to first explore the latest technologies in air-coolers and then decide which of those I want in my air-cooler. Some air-coolers with smart features are described in this article, to help you choose the best one for your home.

Air-coolers work best in hot and dry weather. These work on the principle of evaporation of water into the atmosphere—the more water in the air, the cooler it gets. But there is a limit to the water holding capacity of air. If it is already humid enough, it will not be able to hold more water. As a result, air does not cool to the extent as in drier climates; hence, higher the humidity, lower is the effect of the coolers. Many leading brands such as Bajaj and Symphony manufacture models that have special features for controlling humidity. These are good options for humid coastal regions as well.

Bajaj Electrical launches its first Internet of Things (IoT) air-cooler called Bajaj COOL.iNXT. Anant Bajaj, joint managing director, Bajaj Electricals, on the launch said, “This Wi-Fi Direct and Internet-enabled air-cooler can be operated from anywhere in the world via a mobile app. It has three methods of con-

trol, namely, mobile app, infrared (IR) remote and digital control panel. Its auto mode feature automatically adjusts the fan and cooling speed based on the temperature and humidity sensors. It has five-level speed control and four cooling levels. It also has a digital display, low water level indicator, honeycomb cooling media for efficient cooling and ice chamber for faster cooling.”

In normal mode, the cooler operates at constant speed. In natural mode, it runs at changing wind speed. The LED only displays the set level, which does not change with wind speed. In natural mode, speed of wind decreases by one level every 30 minutes. In sleep wind mode, the cooler works at high speed for 30 minutes and at medium speed, 30 minutes and later keeps working at low speed.

Smart sleep feature enables adjusting the room temperature and saves energy without discomfort. Memory
