

NebuLink Node

A Broad-level component that provides IPv6 internet connectivity

NebuLink Node maintains low-power packet exchange in WPAN. Automatically changes channels to avoid inevitable changes in signal interference. Provides the ability to form large, dense and deep networks, easily covering a large deployment area regardless of external interference.

FEATURES of NebuLink Node

- Self configuring network, enables quick network deployment and formation
- Self healing ability provides Network redundancy with guaranteed message delivery
- Highly Secured Network connection between Network devices
- High precision network synchronization
- Cost effective solution, with lower operational and installation cost
- Remote Firmware update of multiple Nodes with schedule update and instant update feature
- Nebulae 2.4 GHz nodes for Home Area Network (HAN) and Sub-GHz nodes for Neighbour Area Network (NAN)
- Supports various interface options for Sensors like SPI, I2C, UART
- Hardware agnostic framework, allows quick integration with any hardware
