

and the growing insecurity among people regarding the safety of their property and assets, are some of the major contributors to the growth of the global surveillance market. According to Global Terrorism Index (GTI) 2016, India ranked seventh in the list of countries most impacted by terrorism with over 250 terrorism-related deaths in 2015. This has prompted the government to take stringent steps in protecting its citizens by promoting technology-based security systems in the country. A growing number of people have begun to install CCTV cameras, intrusion alarm systems and other forms of security techniques to avoid the frightful consequences of crimes.

Increasing rates of urbanisation and higher levels of foreign investments have prompted higher standards of living among the people, which has boosted the use of security systems.

Foreign direct investment (FDI)

TABLE II TYPES OF SURVEILLANCE SYSTEMS	
Type of surveillance	Brief description
Computers and network surveillance	This technique involves observing and monitoring data that is transmitted over the Internet or over in-house networks, and retrieving computer activity or data stored on a hard drive.
Telephone surveillance	This technique involves surveillance of phone conversations; location tracking and monitoring data over the phone. Traditionally referred to as wiretapping, telephone surveillance has gained immense popularity in home and several business settings.
Video surveillance	This form of surveillance involves detecting and observing moving objects in a particular area. Demand for CCTV cameras and the likes is soaring globally due to rising threat to public and private security.
Social network surveillance	Surveillance of data from social networking sites such as Facebook and Twitter as well as traffic analysis information from mobile phone data is a form of social network surveillance. These social network maps are then data-mined to procure useful information such as personal interests, affiliations, beliefs and activities.
Biometric surveillance	This technique analyses physical or behavioural traits in human beings for authentication, identification and screening purposes. Physical characteristics such as facial patterns, fingerprints and DNA, and behavioral characteristics such as a person's gait or voice are scrutinised for surveillance purposes.

plays a crucial role in modernising a society and boosting economic development. This further promotes adoption of new technologies to a developing society. Several economies today are, thus, advocates of modern surveillance technologies like HD video cameras.

As terror attacks and crime rates increase, the size of human force available to manage such occurrences become relevant. Presently, the number of police officers available in most countries to cater to the needs of the population is considerably low, with the global average rate declining from 305 police officers in 2012 to 297 in 2013 per 100,000 people. This has prompted people to increasingly lean towards security and surveillance systems like CCTV cameras to help monitor sus-

picious activities. Hence, a larger proportion of people are installing technology-based surveillance systems and relying lesser on police personnel for their safety.

The increase in crime rates is not only restricted to the real world but has also managed to trickle down into the virtual world. There have been an increasing number of cases of bank fraud, identity theft, theft of classified information and so on. The financial services sector today has become vastly technology-driven and insists on cashless or paperless transactions. This exposes people increasingly to sophisticated cyber attacks. Similarly, an increase in the number of bank facilities/branches over the years requires heavy security in order to avoid crimes and other sophisticated thefts. This has further fuelled the market for surveillance systems.

In India, apart from the usual drivers such as rising urbanisation, crime and terrorism, and low people-to-police ratio, the government has introduced several initiatives that promote the use of security and surveillance in the country. The Ministry of Home Affairs has issued strict regulations and guidelines for the security of children within school premises, which include installation of CCTV cameras and appointment of a sufficient number of security guards. The
