

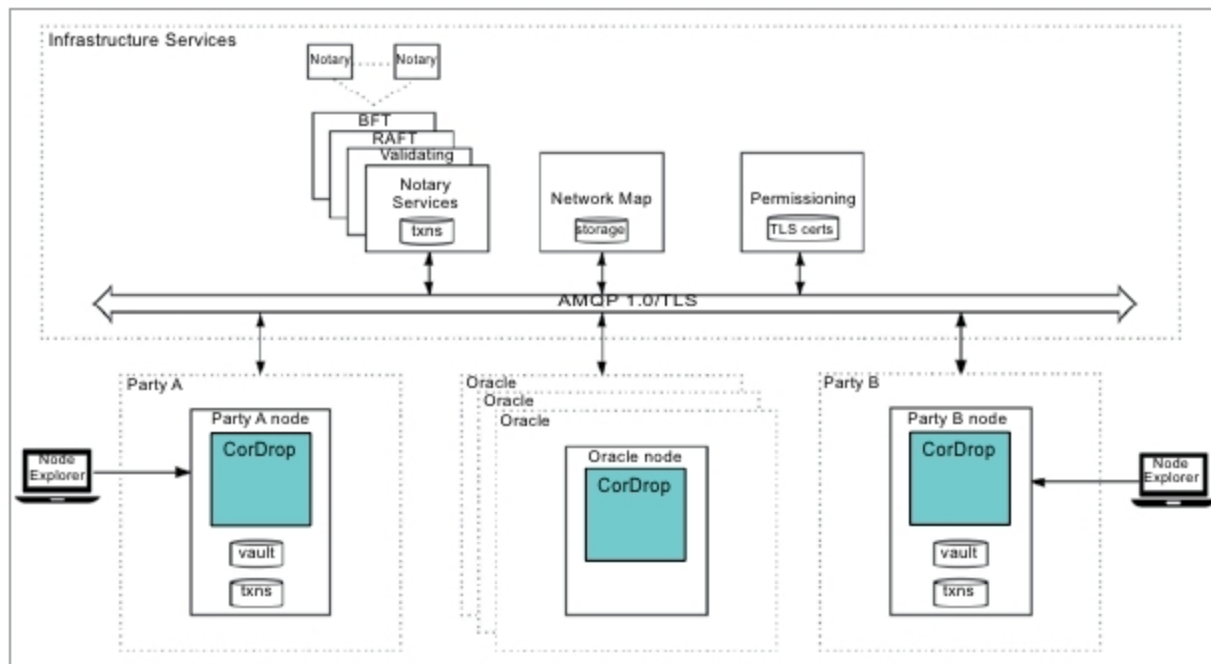

Fig. 3: Components of Corda

- Hyperledger Fabric was designed by IBM as a plug-and-play implementation of blockchain technology for designing high-scale blockchain applications with a high degree of flexible permissions.

- Hyperledger Burrow develops a permissible smart contract machine along the specifications of Ethereum.

Some popular tools of Hyperledger are listed below.

- Caliper is a benchmarking tool that allows users to measure the performance of specific blockchain implementations with a set of predefined use cases.

- Cello blockchain module toolkit brings the on-demand as-a-service deployment model to the blockchain ecosystem to reduce the effort of managing and destroying blockchain.

- Composer creates smart contracts and applications to solve complex business problems.

- Explorer is a user interface to view, deploy and query blocks, transactions, chain codes as well as other relevant information in the ledger.

- Quilt is a payment protocol developed to transfer value across distributed and non-distributed ledgers.

Corda. Corda is an open source distributed ledger platform for recording and processing financial agreements that support smart contracts. The objective of Corda is to provide a platform with common services to ensure that any service built on top is compatible with network participants,

and innovations happen faster.

Corda is the only platform offering the universal interoperability of public networks with the privacy of private networks. As compared to traditional blockchain, Corda ensures minimal information leaks by sharing transaction data only with participants who require it. It maintains confidentiality and provides encryption to client data.

As a smart contract platform and host of distributed apps called DApps, Corda acts as a gateway to a network of fully-interoperable DApps for finance and commerce. These are called CorDApps.

Listed below are some of the key components of Corda. Every node hosts Corda services and executes CorDApps using JVM and communicates using AMQP/1.0 over TLS.

- Permissioning service
- Network map service
- Pluggable notary service types
- Oracle services
- CorDApps
- Corda applications

Latest version: 3.1

HydraChain. HydraChain is an open source blockchain platform designed by Brainbot Technologies and Ethereum Project. It is regarded as an extension to Ethereum blockchain platform, and provides support to create private blockchain networks.

It is fully compatible with API-level as well as contract-level protocols in Ethereum. Smart contracts are designed using Python programming language. In HydraChain network,

MECO®

SINCE 1962

2.5kV - 20GΩ INSULATION TESTER WITH AC VOLTAGE FUNCTION

DIT 918

Features

- 3½ Digit 1999 Counts Large LCD Display
- High Accuracy
- Single Person Push Button Operation
- LCD with Indicator Switch
- Data Holding Function
- Auto Range (Insulation Test)
- Red LED Indicator for HV
- Battery Operated
- As per IS10656-1983
- As per Safety Standard IEC/EN 61010-1 & 61010-31
- Over Voltage CAT III, 600V
- As per EMC Standard IEC 61326 Class B

Electrical Specifications

Specification	Test Voltage	Range
Insulation Resistance	500V / 1000V / 2500V DC	0.1MΩ to 200MΩ
		200MΩ to 10GΩ
AC Voltage Measurement	0 - 600V AC (40 - 60Hz)	10GΩ to 20GΩ

An ISO 9001-2015 Certified Company
