

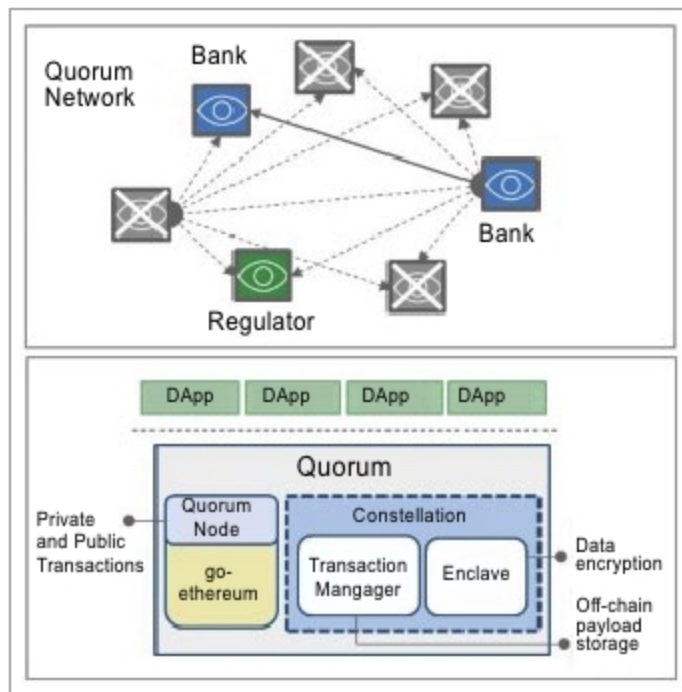

Fig. 4: Quorum network architecture

- Every issuer of an asset has full control over transactions.

There are three modules of Open-chain blockchain, as follows:

- Storage engines, which are the core components. Their primary task is to store transaction chains and records. Modules include Openchain.Sqlite, Openchain.SqlServer, Openchain.MongoDB and more

- Validation engines
- Anchoring media

Elements. Elements, being an open source collaborative project, was designed to bring advanced technological improvements to Bitcoin. It is a blockchain-based digital currency that aims to revolutionise the loyalty rewards industry. It offers a unique platform to multiple merchants to leverage the underlying cryptocurrency technology to boost sales, visibility and customer satisfaction.

It operates on proof-of-work (POW) mining algorithm with X11-changed hashing algorithm as its POW. It provides a universal loyalty currency that can be adapted by various merchants and used by customers as per their requirements.

Components of Elements blockchain are:

- Asset issuance
- Confidential transactions
- Segregated witnesses
- Relative time clock
- SCHNORR signatures

- New opcodes
- Signature covers value
- Deterministic pegs
- Signed blocks
- Bitmask Sighash (under development)

Quorum. Quorum is an open source extension to Ethereum, created by J.P. Morgan. It supports transaction and contract privacy. It was designed especially for applications requiring high speed and throughput in terms of processing private transactions and a permissioned group of known participants.

It has been designed to overcome many of the key challenges of the financial industry. Being an extension to Ethereum, it basically modifies some part of Ethereum core, and integrates all updates of Ethereum without any hiccups.

Quorum supports:

- Privacy at transaction level and maintains a wide, transparent network; is highly customised as per the requirements of the business

- Institutional transaction volumes

Following libraries have been designed especially for Quorum:

- Quorum Blockchain Explorer, which supports viewing of private transactions.

- Quorum-Genesis—a simple CL utility for Quorum to help populate the genesis file with voters and makers.

- Quorum Maker—a utility to create Quorum nodes.

- QuorumNetworkManager, which makes creating and managing Quorum networks easy.

- ERC20 REST service—a Quorum-supported RESTful service for creating and managing ERC-20 tokens.

- Netherium Quorum—a .NET Quorum adapter.

- web3j-quorum—an extension to web3j Java library, which provides support for Quorum API.

MECO®

SINCE 1962

**4½ DIGIT
20,000 COUNTS
DMM - TRMS**

Features

- TRMS Auto / Manual Ranging
- LCD with Backlight
- Upto 1000.0V DC
- Upto 750.0V AC-TRMS
- Upto 10.000A DC / AC-TRMS
- 199.99Ω ~ 199.99MΩ
- 9.999nF ~ 9.999mF
- 99.99Hz ~ 9.999MHz
- Duty Cycle 1% ~ 99%

Special Functions

- Diode Test, Audible Continuity, Data Hold, Low Battery Indicator, Auto Power Off, MIN / MAX, Δ Zero / REL & NCV
