Scilab is an open source and free numerical computing software platform, which can also be used for advanced digital programming. Cross-platform compatible, Scilab can be used for signal processing, statistical analysis, image enhancement, fluid dynamics simulation and numerical optimisation. It can be used as an open source alternative to tools like MATLAB. The software can carry out 2D and 3D visualisation, control system design and analysis using standard algorithms, signal processing and modelling hybrid dynamic systems using Xcos. Its language provides an interpretive programming environment in which matrices are the primary data type. Using matrix-based calculations, dynamic typing and automatic memory management, many numerical problems can be expressed in fewer lines of code compared to similar solutions using traditional programming languages.
