

UPGRADED FEATURES TRANSFORMING THE LAPTOP EXPERIENCE

Deepshikha Shukla

Technology and gadgets are upgrading everyday and our laptops are the biggest witnesses.

All laptops have their own set of features. For example, some come with 4GB RAM, which is enough for regular use—can be expanded up to 16GB for high-end applications. Hard disk size can vary from 500GB to 2TB.

Intel and AMD are the two main manufacturers for laptop processors. AMD provides processors for basic computing, starting with the A4 series, to high-end applications with the FX series.

Intel processors offer a wide range of options—including Celeron and Pentium series, or the popular Core processors, ranging from Core i3 to Core i9. You can select any of these depending on your needs, which can range from gaming to professional-level creative work.

This article will take you through the latest features being added to modern-day laptops that suit individual range of applications.

Core i9. Intel's latest Core i9 processor has a high clock

speed, which greatly improves the processing capacity of the system. With six cores and 12 threads, it has a base clock of 2.9GHz with a boost speed of 4.8GHz. Latest laptops that have this feature are Alienware I7, Asus ROG G703, Gigabyte Aorus X9 and MSI G75 Titan, among others. If you render 3D scenes, edit video or multitask, you will notice a huge performance boost by choosing a 6-core chip over a 4-core one.

USB Type-C or Thunderbolt 3 port. The port can carry data and electric-

ity over a single wire. You can achieve maximum 40Gbps speed using this port. It allows you to copy or transfer files quickly, stream output video to external monitors and power your laptop. All USB Type-C cables are reversible.

Thunderbolt 3 can power up to two 4K monitors over a single wire. It can connect two PCs and achieve a transfer rate of 10Gbps. Many latest laptops have this feature, including Lenovo Yoga, HP Spectre 360, Apple MacBook Pro, Alienware AW15R3 and Asus Rog G752VM.

Solid-state drives. These make less noise, consume less power and are smaller than hard disk drives. Solid-state drives (SSDs) are flash based, and offer longevity, robustness, high temperature operating range, and shock and vibration tolerance. These also have faster write and read speeds, with higher program and erase cycles. SSDs let your laptops boot faster, wake from sleep almost instantly and open large applications in an instant.

Samsung 970 Pro NVMe M.2 SSD is among the fastest consumer SSDs. It provides a sequential write speed up to 2700MBps and read speed up to 3500MBps.

High-resolution screen. Earlier, laptops usually offered 1368 × 768 resolution screens. Now, you can
