

Share Your Knowledge

If you are an expert in your field of electronics, why not share your knowledge with the world?

Electronics For You invites electronics professionals and industry experts to write articles on their area of expertise and interest from different perspectives

Some of the topics we want you to write about are:

- Photonics: Optics & Optoelectronics
- Automation
- Power Electronics
- Components
- Telecom

So if you have an interesting topic or original article to share, please let us know at efyeditorial@efy.in

We would love to hear your good ideas too!

Maintenance. In addition to assembly line, AR and the IoT also improve the way maintenance is carried out. Mitsubishi developed an AR-based 3D software for maintenance, that enables order inspection on AR display and shows the results with voice instructions.

Expert support. Manufacturers need to provide services for machines.

To do so, they sometimes spend a lot of time and money traveling to the destination of the machine. Telepresence is a great solution for manufacturers to provide services virtually, where experts can look through the eyes of technicians (Fig. 5).

Quality assurance. AR helps improve quality assurance of the industry. Recently, Porsche, Germany ran a pilot program where technicians used AR and the IoT as tools for quality assurance (Fig. 6).

Companies supporting AR and the IoT

1. AstralAR drones use a combination of the IoT and AR. These fly using the user's mental commands and integrate a neuromechanical interface.

2. Lampix is a hardware and software solution that can turn any surface into a smart augmented surface (Fig. 7). It uses image recognition, machine learning and sensors that help transform the existing horizontal surface into an interactive one. This platform was created using a simple graphics interface that can be very helpful for developers from a learning point of view.

3. NUVIZ is an AR-enabled helmet for motorbikes (Fig. 8). It incorporates many technological functions into one helmet, including music, action camera, navigation and communication with least noise, to allow the rider to focus on the road. The company believes in the journey being more enjoyable and efficient at the same time.

4. Titanium Falcon introduced a gesture and touch-sensitive controller in the form of a ring (Fig. 9). The wearable ring enables IoT applications such as switching the lights on and/or off, AR/VR gaming and flying drones.

5. LyteShot is an IoT- and AR-based gaming platform that encourages users to play real-time action games (Fig. 10). It uses both hardware and software platforms to integrate and simulate games and players using 3D models. **EFY**
