

3D PRINTING MARKET POTENTIAL

By 2025 3D printing could have an economic impact of US\$ 200 - US\$ 500 billion annually

Tooling and moulds

- US\$ 360 billion market
- 30-50% of plastic moulds could be 3D printed
- US\$ 30 - US\$ 50 billion opportunity

Consumer use

- US\$ 4 trillion market
- 5-10% of products could be 3D printable
- US\$ 100 - US\$ 300 billion opportunity

Other uses

Does not include other opportunities (industrial, medical, etc)

Product manufacturing

- US\$ 770 billion in spend
- 30-50% cost savings
- US\$ 100 - US\$ 200 billion opportunity

manufacturing processes. This, in turn, helps SMEs and startups to reduce their costs of production, and enables large companies to make products cheaper, faster and better.

Market drivers

The A&D vertical holds the largest share of the global 3D printing market. In the aerospace industry, 3D printing is mainly used to manufacture critical parts of airplanes or for low-scale production associated with components demanding high performance and quality. This industry holds a promising potential for the market. However, markets for emerging verticals, namely, food and culinary, printed electronics, education and energy, are expected to grow at a significant CAGR in the near future.

According to industry sources, automotive applications account for the highest revenue share in the Indian 3D printer market. However, industrial and education applications have also emerged as major growth drivers along with automotive applications. Besides these, architectural, healthcare, A&D-related applications will also witness growth. Other niche applications include arts and crafts, interior decoration, fashion accessories, footwear designs, jewellery designs, animation and gaming, furniture and modelling. Medical application is another upcoming growth area for 3D printers.

Demand for 3D printers in India is primarily driven through Tier-I cities. These areas account for the major potential growth for domestic

manufacturers, local assemblers and distributors. Industrial customers are of primary importance for the 3D printing industry. However, private or individual customers are also showing interest.

Moving forward

The Indian 3D printing industry can witness healthy growth in the near future, considering expected price decline and increasing market awareness coupled with major transformations like easier design capabilities, compatibility for mass production and manufacturing of large-format objects.

Till now, the Indian 3D printing industry was not at a stage to create the factory-at-every-home atmosphere. But, it has every potential to facilitate the next industrial revolution in the country on successful resolution of the following challenges:

1. Inefficient supply chain for raw materials and components required for 3D printer manufacturing
2. Limited availability of experience zones for Indian 3D printer manufacturers
3. Performance limitation of existing low-cost printers and expensive nature of advance 3D printing technologies
4. Market infiltration with poor-quality products
5. Highly cost-sensitive market with price pressure due to the presence of cheaper CNC milling machines (used for modelling), resulting in reluctance among consumers to purchase 3D printers
