COMPONENTS

Insulated-gate bipolar transistor

Infineon Technologies has launched a 1200V insulated-gate bipolar transistor (IGBT) generation TRENCHSTOP IGBT6. It is the first discrete IGBT duo-pack manufactured on 30.5cm (12-inch) wafer size. The product family is optimised for use in hard-switching and resonant topologies operating at switching frequencies from 15kHz to 40kHz. Typical applications for IGBT6 are uninterruptible power supplies, solar inverters, battery chargers and energy storage.

Infineon Technologies India Pvt Ltd

accepts input voltages of up to 480V AC. It is OVC III rated with 6kV surge protection, and operates reliably at industrial temperature ranges. The series is ideally suited for housekeeping operations in Industry 4.0, the IoT and smart process automation applications that require low standby power consumption as well as the ability to provide peak power.

Energy-metering IC

Analog Devices has introduced an energy-metering IC with auto-calibration for single-phase energy measurement applications. ADE9153A uses mSure technology to automatically calibrate the measurement system, significantly reducing calibration time, labour and equipment costs. It enables designers of intelligent lighting, data centres, EV charging and industrial applications to add with ease billing-grade accurate energy measurement to their products.

Power-monitoring IC

In systems that use both AC and DC power, implementation of dual-mode power monitoring requires multiple ICs to ensure superior performance and accuracy. Growing applications such as solar inverters, smart lighting and cloud servers often use both modes to maintain safe operation,

with AC as the main power source and DC as backup, or vice versa. To optimise performance and ease development of these systems, Microchip Technology has released a flexible dual-mode power monitoring IC that measures both AC and DC modes with an accuracy of 0.1 per cent error across a wide 4000:1 range. Power calculations and event monitoring are included with a single IC, reducing bill of materials (BOM) cost and firmware development time.

Ultra-thin LCD

Electronic Assembly has designed EA DOGL128, a 128 × 64-pixel graphics display, adding to its EA DOGL series.

Some benefits are:

- Maximum contrast, not only when viewed perpendicularly, but also at an oblique angle from above, right or left
- Available in FSTN and STN technologies
- 3.3V supply voltage in single supply operation
- Display interfaced via serial four-wire SPI

Audio amplifiers

FDA803D and FDA903D digital input automotive audio amplifiers from STMicroelectronics simplify integration and maximise reliability in telematics and emergency-eCall equipment, acoustic vehicle alerting systems in hybrid/electric vehicles and to enhance high-end infotainment systems.

With I2S and TDM digital audio inputs and feedback-after-filter topology for low noise and high sound quality, these 1x45W class-D amplifiers simplify design and save BOM costs. Combining

Power-management ICs

With a pair of high-performance and scalable power-management integrated circuits (PMICs) from Maxim Integrated Products, designers of mobile systems can now maximise performance per watt, while increasing system efficiency for computationally-intensive deep-learning systems-on-chip, FPGAs and application processors. MAX77714 and MAX77752 address a broad spectrum of applications ranging from augmented reality/virtual reality, gaming, solid-state drives, security and Industrial Internet of Things (IIoT) to handheld devices such as cameras and home automation hubs. Architected to deliver numerous benefits, including consuming 40 per cent less power than standard solutions, these PMICs extend battery life while providing an extremely compact form factor.

AC-to-DC converter

RECOM has announced a 5W AC-to-DC converter, RAC05-K/480 series, which
