

tent, you will need a wired Ethernet connection or a very-high-speed Wi-Fi connection to ensure you have the required bandwidth to pull it off.

You can download different apps on your TV, log onto them, and enjoy your favourite music, shows and movies. For apps like Netflix or Amazon Prime, you will need to buy a subscription to explore the content.

Many smart TVs have integrated social networking apps like Facebook, LinkedIn and Twitter. These devices can also help children with their studies through various interactive learning apps.

Split-screen option allows watching live TV while browsing an app.

Wireless pairing with your mobile device will enable you to see images and videos from your mobile device on the big screen. Android TVs have built-in Chromecast, which makes it easy to see content or stream from a compatible cellphone.

iPhone users can download AirBuddy app to see content on an Android TV.

A digital assistant, like Alexa and Google, or other voice search integration technology is an advanced feature available in some high-end TVs. There is also an enhanced voice recognition or control system that provides access both to the TVs' features and effective voice search feature. It is totally up to you whether you want to opt for this feature, as it can increase the price of the TV.

There is another advanced feature available for those living in smart homes, where the TV provides an on-screen hub for monitoring and controlling smart devices like smart fridges,

Difference between OLED and QLED TVs

thermostats, washing machines, lights and so on, on a network via platforms like ThinQ or Samsung's SmartThings.

Display technologies for the best experience

High dynamic range (HDR) content gives much more information to the display and a spectacular HDR picture quality. However, this is not applicable to 1080p HD sets, where the resolution is the same as UHD but range of colour and amount of light each pixel can produce is more.

HDR is still a developing technology. There are two major commercially-available HDR standards for content: HDR10 and Dolby Vision. HDR10 is an open platform that uses 10-bit colour values, while Dolby Vision is a closed standard used by Dolby, which supports 12-bit colour.

HDR10+ is an advanced version of HDR10. It changes the range of brightness and darkness that a video can display from scene to scene.

High-end televisions with light-emitting diode (LED) and organic LED (OLED) technologies can display wider colour gamuts and finer gradients of light and dark. OLED and quantum-dot LED (QLED) TVs look much better than typical LED TVs, but these are considerably more expensive.

OLED sets do not require a separate backlight like LEDs, and this makes them lighter and thinner. OLED has many advantages over QLED, such as faster refresh rate, better contrast (true blacks) and colour reproduction, much thinner panel, better viewing angle (almost 180 degrees), higher efficiency, ability to be flexible or transparent. QLED technology is better than OLED in terms of ultra-brightness (1500 nits), variable screen size and greater life span, among other things.

Built-in sound technology

A private listening mode via headphones that plug into the remote is
