1 Precision Treatments Unfold As AI TAKES OVER HEALTHCARE

➤ Medical professionals have identified the scope of improving success rates and quickness in treatments while reducing mortality with the help of AI tools. This opens up opportunities for AI solution providers to find a high demand market

AI in healthcare (Credit: Flickr)

In August 2018, Microsoft and Apollo Hospitals announced a collaboration in healthcare. To predict the risks and patterns of cardiovascular diseases (CVDs) in Indian citizens, they leveraged on artificial intelligence (AI) to create a CVD Risk Score API platform. The CVD vulnerability rate, causes and patterns in the Indian population are quite different from the rest of the globe. The AI-powered

API helps predict these risk scores and patterns based on parameters like diet, tobacco consuming and smoking habits, body fitness, psychological stress and others, precisely as per Indian conditions. This allows hospitals to plan diagnoses and treatments in time for incoming patients.

This is a small example of how AI and cognitive technologies are creating a shift in healthcare today.

Manipal Hospitals are using IBM Watson cognitive platform in their oncology department for faster and better treatments. Doctors are looking at smart technologies for various reasons—be it for more accurate diagnoses, quick reference to remedies or for consultation on-the-go. We delve deeper into this and look at solutions currently being used.

Real instances of AI in healthcare

The main expectation of healthcare specialists from AI-based medical approaches is to promote precision treatment and, in turn, improve their success rate with regards to treating patients. To provide treatment suggestions and success predictions, cognitive platforms feed on a variable array of data across many medical cases, including medical histories, genomics of patients, treatment processes, medicines and cures used, patient's behavioural patterns, financial estimates and more.

Keeping this in mind, AI is also being looked at as a tool to find, or at least support in finding, cures for dif-
