

Marvels Of The Emerging HEALTHCARE TECHNOLOGIES

AR and VR in healthcare (Credit: vStream)

From small innovations like fitness bands to larger, more complex technologies like artificial organs and robotic prosthetic limbs, technology is laying the path for accurate health treatments. Technology helps doctors make sure the right patient receives the right treatment at the right time

Technologies like augmented reality (AR), virtual reality (VR), artificial intelligence (AI), blockchain, sensors and the Internet of Medical Things (IoMT) will shape the future of the medical world in the coming years. Technologies will boost the capabilities of doctors and researchers, whereas patients will get the benefits of new treatments, better healthcare devices and medicines. With advancements in medical technology, patients will be able to make more informed decisions by considering online reviews from apps, social media or friends.

Digital tools and software will help

healthcare services to evolve to create unprecedented levels of transparency and transform the way patients interact with their doctors. These will fulfil the demand for instant response and feedback with online scheduling to book, change or cancel appointments. Demand for notifications and reminders about appointments, annual checkups, test results and price promotions will also grow.

Role of digital technology

Mobile technology links patients and healthcare professionals through smartphone apps and wearable tech products. It helps users record data,

which could be further communicated. Digital technology has the potential to increase the number of patients seen daily by doctors, promote patient independence and increase focus on prevention.

A mobile working solution reduces paper work, hospital admissions, hospital bed use and cost. Today's patients can use digital technology to research information online, share experiences and identify treatment options. Digital communication promotes e-visits, e-prescriptions and remote monitoring of changes in the health status of patients. Some applications can even keep track of
