loop insulin delivery system that connects a continuous glucose monitor with an insulin pump to test and manage insulin levels. MiniMed 670G is the first insulin pump to win FDA approval. It is designed to automate blood sugar management by monitoring glucose levels continuously and providing insulin that can stabilise blood sugar levels when required. All of this is managed by an algorithm, or computer model, that connects the insulin pump to the smartphone.

Laws for using healthcare electronic equipment

There are millions of electronic products manufactured every day to provide the healthcare industry with greater efficiency and convenience. However, equipment and computers containing toxic materials, if disposed improperly, can be a threat to public health and the environment. To avoid this, there are three important federal laws that must be followed by healthcare providers:

Health Insurance Portability and Accountability Act (HIPAA). It

requires confidentiality and security of health data stored on computers and other electronic equipment.

Resource Conservation and Recovery Act (RCRA). It manages hazardous waste disposal of computers and other electronic equipment so that these do not end up in landfills.

Comprehensive Environmental Response Compensation and Liability Act (CERCLA). This states that the creator of a product containing hazardous substances is liable for its proper disposal throughout its life, even if the product is sold to someone else.

Healthcare facilities can address this issue through the purchase of equipment with fewer toxic components, in addition to extending the life of equipment and purchasing products that incorporate recyclability and reusability into their designs.

To sum up

Some patients become victims of misdiagnoses or flawed medical procedures, medical staff's failure to track medications or wrong medication. The future of healthcare will change with advancements in medical technology. Technology and healthcare will go hand in hand to uplift patient care levels. From small innovations like fitness bands to larger, more complex technologies like artificial organs and robotic prosthetic limbs, technology is laying the path for accurate health treatments. Technology helps doctors make sure the right patient receives the right treatment at the right time. **EFY**

Efficient & Cool

TRINAMIC CoolStep™

Motors controlled with CoolStep™ can reduce motor heat by up to 80%, making your application more sensitive and reliable.
