

Testing In A MULTI-CONVERGED WORLD: What Lies Ahead

Convergence at its core revolves around the sharing of ideas that allow for learning from other industries to be leveraged in order to avoid wasting time and effort on creating solutions that already exist. While this is often discussed in the context of product innovation, the analogy can also be applied to test strategies

Luke Schreier is vice president - product management for automated test, National Instruments

The concept of industry convergence has been an intrinsic element of the market fabric over time. Interactions and encounters between markets naturally lead to the exchange of ideas, processes and technologies. Examples of this would be the collision of agriculture and trade to create banking and, more recently, the overlapping of potential between healthcare and consumer electronics to create wearables. Further opportunities for fast, large-scale convergence are only set to increase as our society continues to become more globally connected.

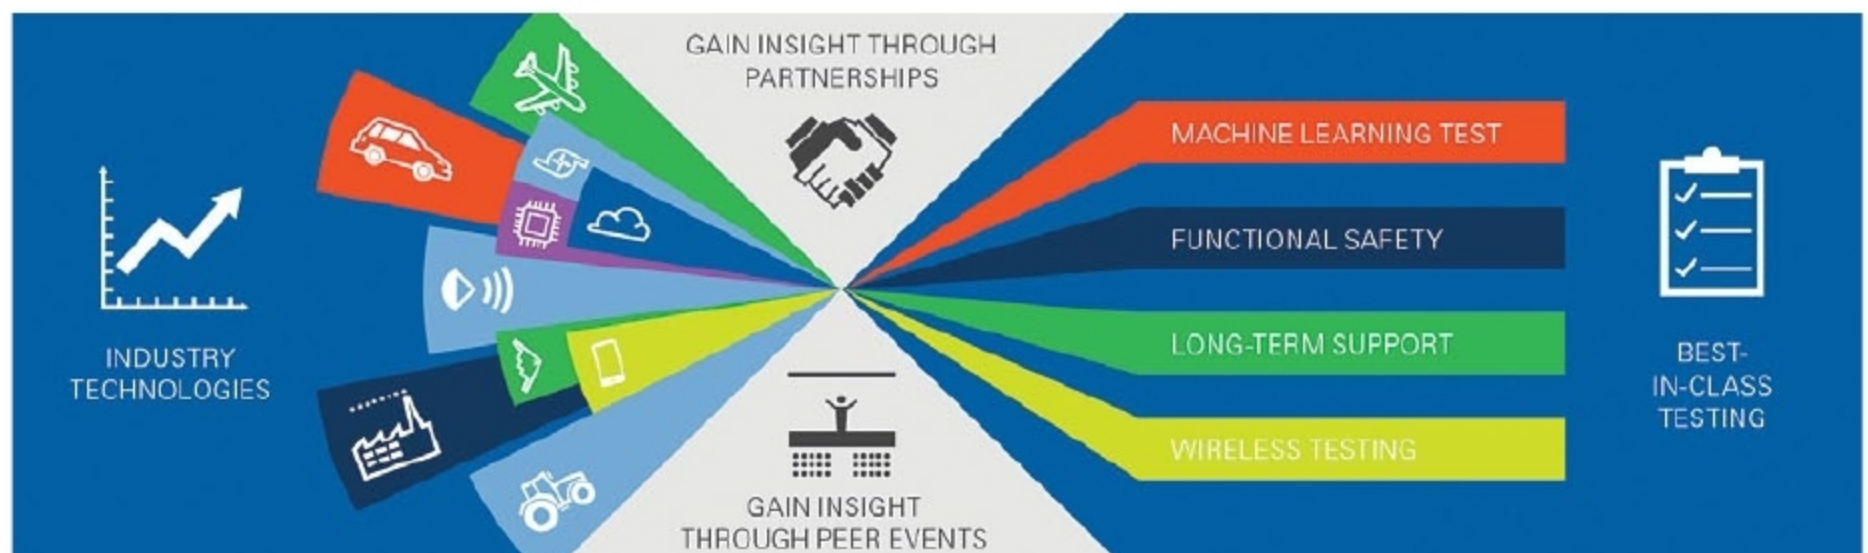

While the commentary on multi-industry convergence has gained greater visibility as a result of the digital revolution, test organisations are rarely examined for the same. Convergence represents a dichotomy of threat and potential today and, thus, best-in-class organisations are

looking to tackle it directly by leveraging multi-industry test platforms and partnering with and learning from other organisations with multi-industry exposure.

Creating test innovation

According to a 2014 report by Gartner titled 'Industry Convergence: The Digital Industrial Revolution,' industry convergence has been dubbed as the most fundamental growth opportunity for organisations. For test organisations, this opportunity will come through learning and leveraging from other industries and pooling resources to accelerate innovation.
