Medical electronics deals with the design, implementation and use of electronic devices and equipment for medical or healthcare purposes. Typical applications of medical electronics include research, examination, diagnosis, treatment, assistance and care. Medical electronics technology deploys field disciplines of both electronics and biomedical. Influx of this technology has reinforced the existing healthcare infrastructure in various ways, right from digitising medical tests, diagnostics and

therapeutic procedures to enhancing the reach of healthcare through telemedicine and health IT.

Use of electronic equipment in the medical field for clinical and research purposes has increased tremendously in the past few years. A human body generates numerous signals that are highly significant for diagnosis and therapy. These signals are collected from the body surface or from within, through electrodes of different sizes, shapes and types.
