Moreover, there are non-electrical body parameters like temperature, blood flow, blood pressure and respiratory functions that need to be routinely monitored. These parameters are converted into corresponding electric signals by various transducers, and here comes the role of electronics. Extensive use of computers and microprocessors has now been introduced in medical instruments to perform routine clinical measurements, particularly in situations where data computing and processing could be considered a part of measurement and diagnostic procedures.

The strong growth of the Indian economy also boosts the country's healthcare industry. According to Indian Brand Equity Foundation (IBEF), the Indian healthcare industry is expected to grow to US\$ 280 billion by 2020. This in turn creates a huge demand for electronic components, devices and products that are used for medical purposes. India as an emerging market continues to be relevant in the global medical technologies space, not just from a market point of view but also as a global hub for innovation and manufacturing.

Market growth

A Global Market Insights study predicts that the global medical electronics market size was US\$ 73.3 billion in 2018 and is set to exceed US\$ 169 billion by 2025 (Fig. 1) with an expected CAGR of 13 per cent from 2019 to 2025. The same study also indicates that increasing preference for minimally-invasive surgeries will

foster medical electronics market growth as adoption of medical electronics devices like patient monitoring equipment and other diagnostic tools is quite high in such surgeries. Therefore these techniques have positively impacted the demand for medical electronics devices.

Technological advancements will also accelerate industry growth over forthcoming years. Key medical electronics industry players continuously focus on integrating advanced technologies within devices that enables accurate and efficient diagnosis as well as treatment.

Rising adoption of medical electronics devices in emerging economies such as India will significantly boost industry growth. Although these devices are expensive, several government initiatives and favourable FDI policies will trigger their adoption among healthcare professionals. How-

ever, stringent regulations enforced on companies involved in the manufacturing of medical electronics devices will restrain industry growth in the forthcoming years.

Also, governments in emerging economies implement several decisions such as price reduction of medical electronics devices. Such decisions positively impact the demand for such devices by resolving affordability issues. However, stringent regulatory scenario and trade policies associated with such devices will hamper the industry growth to some extent.

Market segments

The medical electronics market ecosystem includes researchers and developers, component manufacturers, system integrators, software service providers, distributors, marketing and sales, end users and post-sales services.

The medical electronics market by product type (Fig. 2) can be categorised as:

- Invasive (therapeutic)
 - Pacemakers
 - Implantable cardioverter defibrillators (ICDs)
 - Implantable loop recorders (ILRs)
 - Spinal cord stimulators
 - Gastric electrical stimulators
 - Endoscopes
- Non-invasive
 - Imaging devices
 - Patient monitoring devices/systems
 - Handheld/portable homecare products
