

Pure Skies 3000 unit

dioxide, and particulate matter including PM10 and PM2.5. It increases due to increase in smoke, lack of dilution of air pollutants, low wind speed, and burning of garbage or residuals. It can also decrease with an increase in wind speed or rain.

Devic Earth's Pure Skies systems improve air quality over large areas. A single Pure Skies 3000 or a single Pure Skies 6000 unit can improve air quality inside an entire home, building or factory. Whereas, a single Pure Skies 9000 installation improves air quality by 33 per cent up to a radius of 10 kilometres in cities and heavy industries, depending on topography and height of nearby buildings. These units are compact, consume less power and are simple to install.

Each Pure Skies system has two components:

- Air pollution control equipment, which contain omnidirectional antenna, power system, remote monitoring and control, small UPS and security/alarm system
- Air quality monitor, which measures local ambient air pollution levels, monitors system efficiency and provides real-time feedback to optimise system function and performance from any Internet-connected device

The antenna generates weak radio waves at specific intervals at

a particular frequency, which does not affect other forms of telecommunication. RF testing of these radio waves shows no interference with radio, Bluetooth, TV, Wi-Fi or hand-held transmitters. It does not affect humans, agriculture, water quality, insects and birds either.

The system uses a natural process called dry deposition to neutralise pollutant particles and aerosols. Pulsed radio waves accelerate the velocity of very small particle pollutants—less than 20 microns—and aerosols. Dry deposition clears 50 to 66 per cent of atmospheric pollutants, depending on

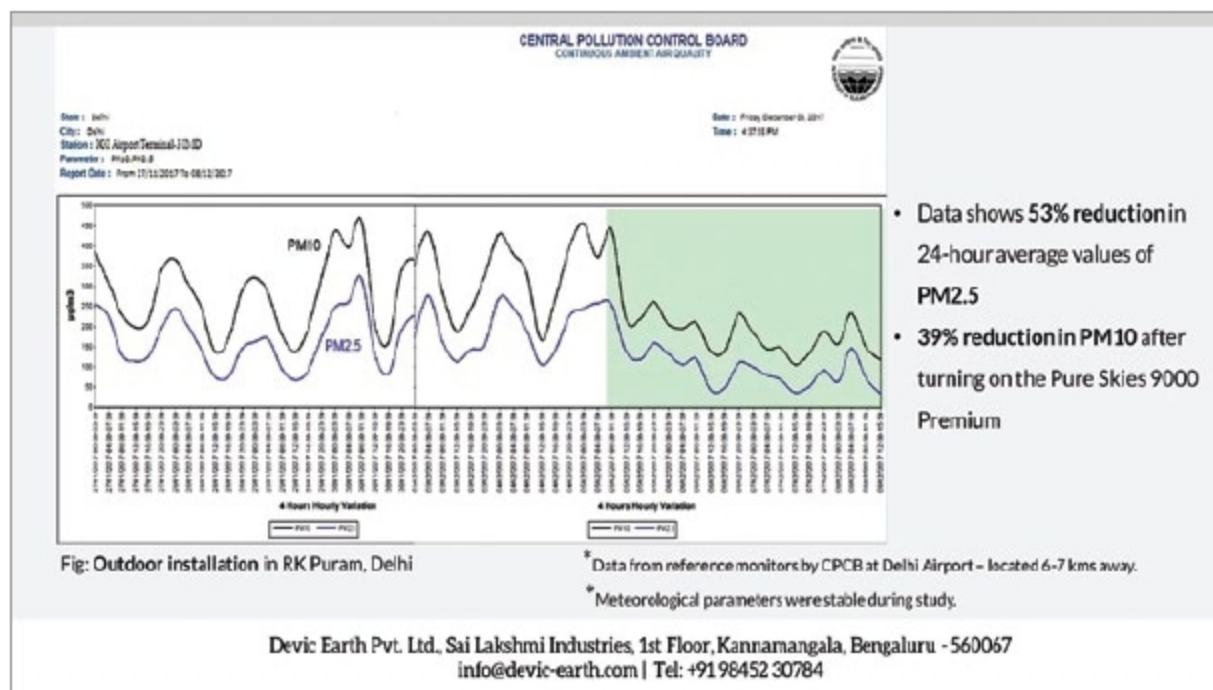

climate, aerosol or particle size, and meteorological factors. It improves air quality over large areas by reducing pollutants in the air. Most of these particles settle down on the earth's surface or are absorbed by soil or vegetation, except sulphur-dioxide and heavy metals that cause acid rain. Ozone is also not affected by Pure Skies system.

Although, Pure Skies is a young startup with sales starting three to four months back, it has the units installed at various locations with challenging scenarios in heavy-duty manufacturing industries, coal-fired power plants or polluted cities like New Delhi, Kolkata and Varanasi. Performance of the system can be optimised based on work hours, environment conditions and geographical areas.

"With rigorous R&D of 10 years, we have designed a commercially-viable solution for air pollution. We have achieved more than 33 per cent improvement in pollution levels," says Dr Srikanth Sola, chief executive officer and co-founder, Devic Earth.

Limitations of Pure Skies system

Pure Skies' efficacy decreases with distance or with large obstacles such as hills or buildings. These limitations can, however, be overcome by installing multiple Pure Skies units across a large geographic area. For outdoor
