

more than search and actually converse with these AI engines—the more users converse with them, the more they will churn out not just desired results but intelligent, witty and often deliberately humorous responses. The engines learn how to break through the semantics of voice and language, jargons, multiple meanings and contextual complexities.

For digital advertisers and marketers, NLP is used for text-to-speech, email, conversion, healthcare, e-learning, drawing qualitative insights from customer interactions, figuring out through AI the sentiment one may hold towards a product or business or experience, and so on.

Q. How does voice search impact search engine optimisation (SEO)?

A. Voice search platforms give users immense comfort, which, in turn, doubles voice search optimisation. To gain a grip among target users, SEO will play a crucial role in the digi-

tal future. As there are more prolific and organic searches made, platforms like Google are investing to focus more on voice search optimisation.

Such companies need to up the ante and invest in SEO to rank higher and to get a more targeted audience.

Q. What is the role of AI and ML in voice-based search?

A. If we try to chart out an effective strategy to target audience through advertising, it can be said that both AI and ML will prove to be beneficial. On one hand, ML systems have an advantage already due to the algorithms. It is expected to trend more with mobile in-app advertisers.

On the other hand, AI holds the promise that audiences can be approached with the right advertisement strategy with the help of advanced vision algorithms and performance data, and brands can take the plunge into determining the right brand strategy for the current trends

and the scope of creativity that will perform well in future.

Q. What are the innovations around voice-based search?

A. Businesses will start refining the availability and usability aspect of content, which is being made accessible to users. Few innovations around voice search are IBM Shoebox, Apple Iris and HomePod, Microsoft Voice Search, Google Voice Search, Amazon Alexa and Echo, Samsung Bixby, Alibaba Genie X1 and Google Duplex.

Q. How are you planning to contribute to this technology?

A. ComScore says that more than fifty per cent of searches will be voice based by 2020. As a tech tuned organisation we are more inclined to integrate our advertising strategies towards innovating more tech and content solutions keeping in mind the vertical demand of this format of Internet consumerism.

E-MOBILITY DRIVING THE WORLD TOWARDS CLEANER TECHNOLOGY

By increasing e-mobility and improving the EV ride experience, solutions like PlugSurfing are paving the way to make a clean and efficient transport accessible to drivers across the world

As seen often, unavailability of charging stations and battery swapping option in electric vehicles (EVs) make people skeptical about buying an EV. To dispel this notion, PlugSurfing GmbH, a German electric car charging and payment services provider, was founded by Adam Woolway and Jacob van Zonneveld in 2012. The company works towards making charging as simple and affordable as possible. Initially, the challenging part for them was to convince people from different fields about the feasibility of EVs, and ensure that the work done was fast and accurate.

Now, it partners with more than 430 charge point operators such as

Innogy, EnBW, Last Mile Solutions, E-charge 50, Plus De Bornes, Allego and Vattenfall to offer access to over 110,000 charging points in a number of European countries, including Germany, Austria, Switzerland, Belgium, Luxembourg, Netherlands, France, Denmark, Finland, the UK, Italy, Spain, Croatia, Iceland, Portugal, Romania and Uruguay.

To start with PlugSurfing, the user needs to create an account via the app or the website for free. The app is available for both Android and iOS. Supported payment options are Visa, Mastercard, AMEX and Paypal. Once the payment method has been approved, a test amount of one euro is

charged, which is reimbursed immediately. The app allows the customer to find nearby charging stations compatible with the car. Detailed information including location, opening times and live status is shown on PlugSurfing Map, which is directly obtained from charging point operators.

Charging points are displayed even when there is a weak or no Internet connection. A green point indicates that the charging point is available, while red indicates that the point is either occupied or out of order. Prices displayed on the app or website vary for each operator based on starting a session, kWh energy consumption or parking time at the charging station.
