RULES FOR AUTONOMOUS VEHICLES

The article "Writing The Rules For Autonomous Vehicles" published in May issue is very informative.

Urmi Pant

EFY. Thanks for the feedback!

...

VEHICLE TRACKING

This is regarding "Vehicle Tracking System Based On GPS and GSM" DIY article published in April 2018 issue, which is also available on your website <https://electronicsforu.com>. After the LCD shows GPS initialisation, no GPS range is found. Please guide me.

Onkar Bhokare

The author Vivek Kamboj replies:
It seems your GPS is not getting signal from the satellite. Place the GPS module outdoor (on the roof or near the window) and ensure that it is getting power supply from the DC adaptor.

Electronics Projects

I am interested in "Bhajan and Chanting Amplifier" DIY circuit available on your website <https://electronicsforu.com>.

I would like to assemble it for my personal use. Where can I get the ICs used in the circuit?

Ankush Gupta

EFY. ICs used in the circuit were bought from Vegakit (India) Pvt Ltd, Mumbai.

Let me know if I can get the PCB for "Bhajan and Chanting Amplifier" circuit. I want to use it with the water overflow alarm as a continuous mantra system.

Sachin Bhomia

EFY. PCB for this project is not available right now. You may refer to "Water Overflow Alarm" circuit on website <https://electronicsforu.com>

This is regarding "Simple 12V, 1A SMPS" DIY circuit available on your website.

Where can I get EE20 core?

Can I replace EE20 core flyback transformer used in the project with another transformer?

Pritam Paul

The author Ashvini Vishvakarma replies:

EE20 has no replacement. It is inexpensive and widely available. You can find it in the SMPS of every DTH set-top box.

I have a doubt regarding "Two-Watt TBA820M AF Amplifier" circuit available on your website.

Please tell me the part name and footprint of TBA820M audio amplifier.

I was not able to find these in PCB capture.

Priya

EFY. Thanks for visiting the website!

Regarding PCB capture, it is not clear which PCB tool you are using. TBA820M is a normal eight-pin DIP IC. If this IC is not in the library of your PCB design software, you can create a new component symbol by referring to its datasheet.

Almost all PCB design software tools have an eight-pin DIP footprint in the library. For example, in gEDA PCB software, you can create TBA820M symbol and add it to the schematic component library. Then, you may add the eight-pin DIP footprint for TBA820M in schematic from Attribute shown in the figure below. Finally, capture the schematic to the PCB.

Thank you very much for publishing "Water Overflow Alarm" circuit available on your website.

I have successfully assembled the

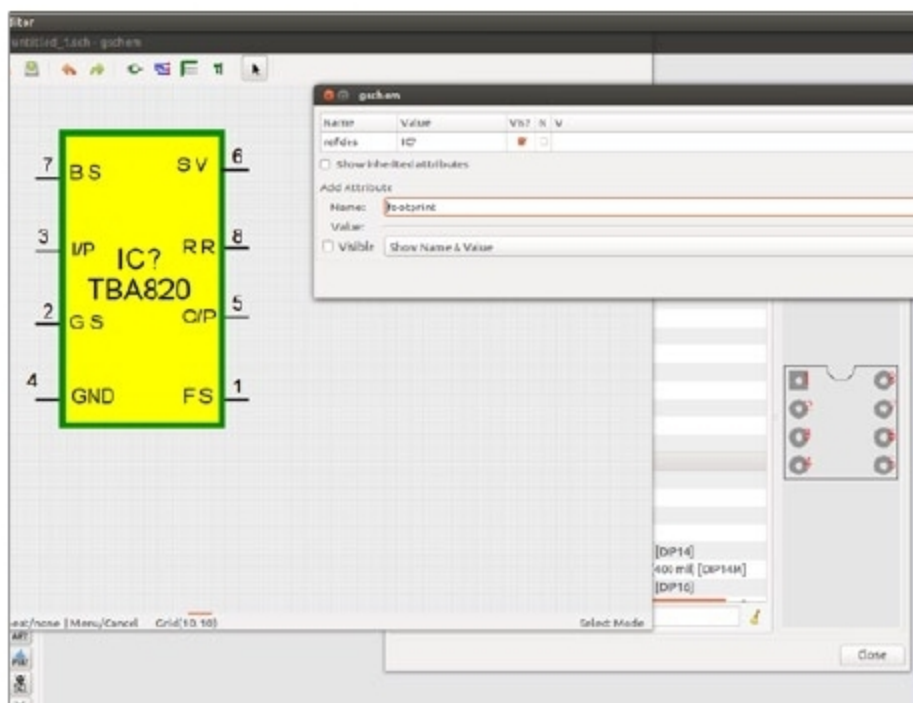

circuit and it is working well.

How can I check the oscillation frequencies and change volume?

Turyamureeba

EFY. Thanks for the feedback!

You can check oscillation frequencies at pin 3 of both IC1 and IC2, when water is empty as well as full. You can also vary VR1 to control volume of the alarm sound.

TBA820M footprint in gEDA software
