

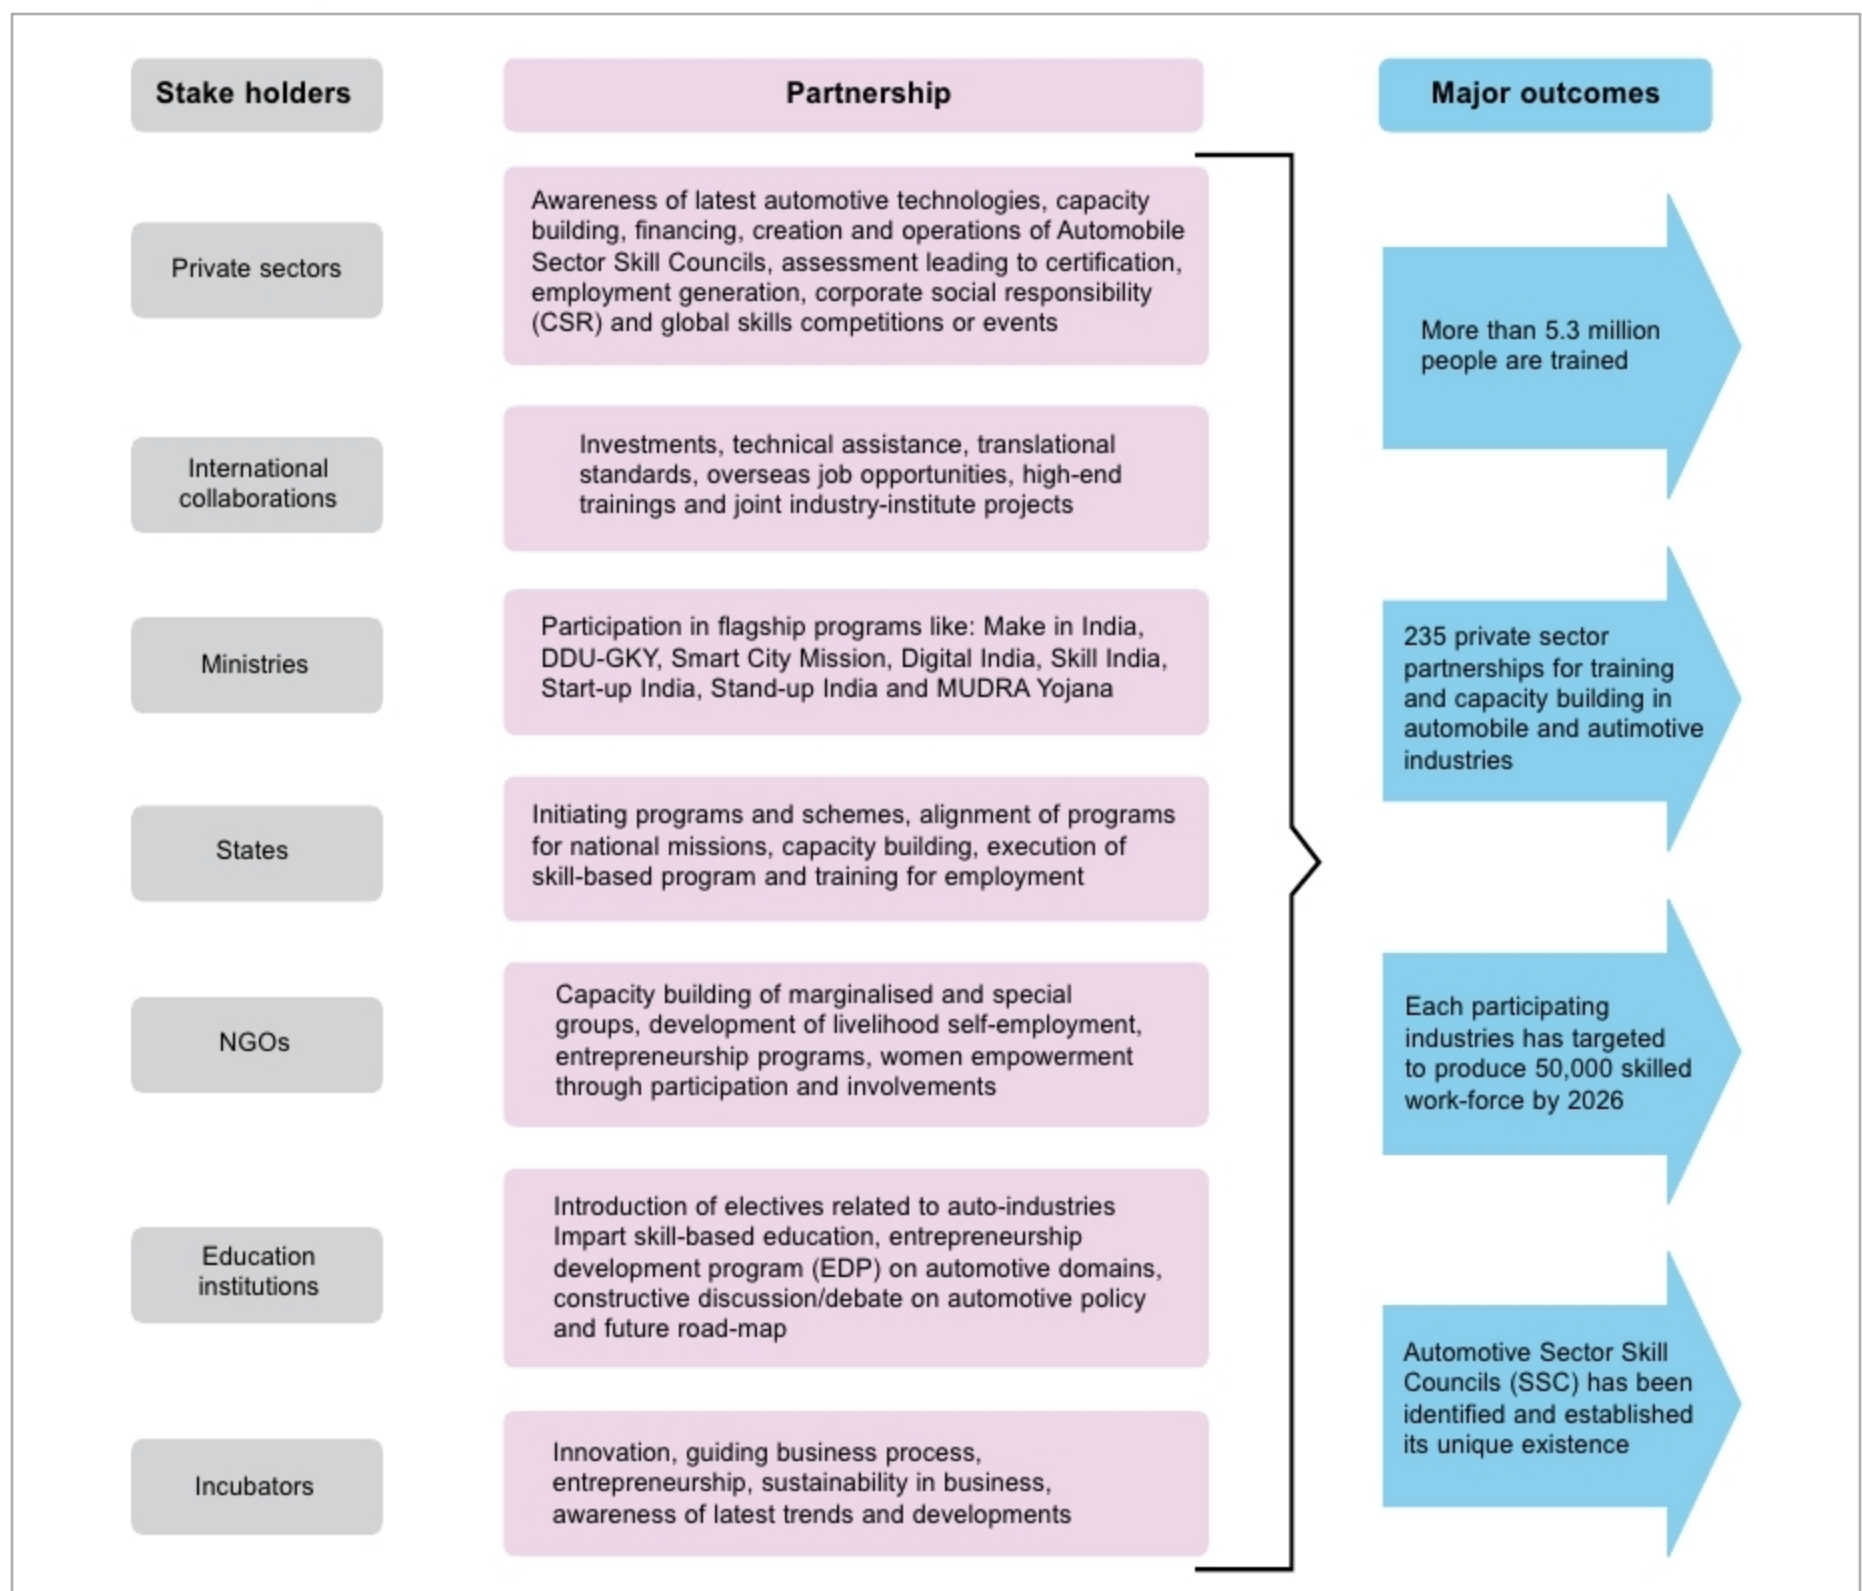

Fig. 2: Overview of skill sectors and objectives through partnership

AMP 2006-2016 recognises the importance of the emerging technologies, which will carry forward the momentum of India's success in the automobile sector to achieve the objectives set out in AMP 2006-2016, of increasing production, exports and skilled workforce that aims to create around 65 million jobs in the automotive industry.

Digital transformation in the automotive industry has compelled manufacturers to produce high-quality products in a competitive environment. This leads to better operational optimisation as well as cost savings for the accurate information of customer feedbacks and preferences.

Future roadmap

With radical developments and globalisation, the world is opening up newer avenues for the transportation industry in the domains of electric, electronic and hybrid cars, which are deemed more efficient, safe and reliable modes of transportation. Over the next decade, this huge shift will open newer verticals and opportunities for auto-component manufacturers, who would be forced to adapt to the change through systematic and high-end research and development through hi-tech infrastructures.

The Indian auto-components industry is set to become the third largest in the world by 2025. Indian auto-component makers are well-posi-

tioned to benefit from the globalisation of the sector as exports potential could go up to US\$ 30 billion in the next five years.

Automotive Skills Development Council (ASDC) has active partnerships with various stakeholders in accelerating, catalysing and evolving the skilling ecosystem of India. ASDC aims to achieve its objectives through:

1. Value-addition in automotive skills
2. Integration of skills through academic/research support
3. Recognising the achievements in the automobile sector

ASDC is expected to achieve the objectives through the approach shown in Fig. 2.
