

EFY Note

The source code of this project is available for free download at source.efymag.com

en/Main/Software and Processing software from <https://processing.org/download>

2. Connect Arduino board with laptop or computer using a USB cable and open Arduino code (efy_temp.ino) using Arduino IDE software. Under Tools, select the board as Arduino/Genuino Uno and correct COM port. Next, compile the code and upload it to Arduino board.

3. Open Processing source code (dee_efy.pde) using Processing software. Add the audio library (minim) in this software for voice alerts. For this, go to Sketch > Import Library... > Add Library... > minim. In filter box, search for minim and click on Install, and wait for a few seconds.

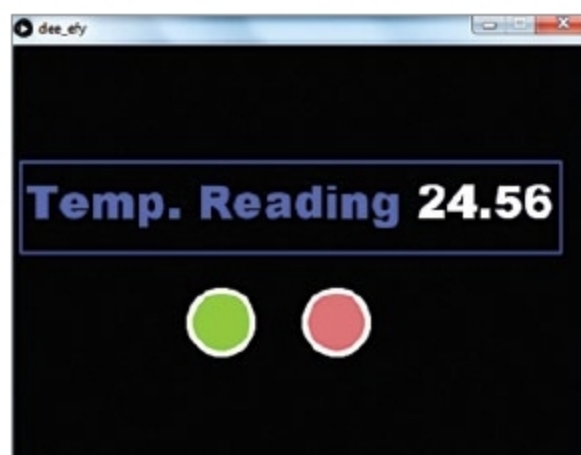

Fig. 3: Temperature reading on GUI

4. Add fonts for your GUI. For this, go to Tools > Create Font, select Arial-black-48 and click OK. Colour codes can be obtained from Tools > Color Selector option.

5. Replace COM12 port number in Processing code with your own COM port number. Check COM port under Windows Device Manager. Save the code before running it. Note that the pre-recorded audio files to be played, colour font file and Arduino code should be inside the data folder on your PC.

6. Run the code and a GUI will open with temperature value, as shown in Fig. 3.

In the GUI, green LED will glow when temperature is below the pre-defined limit (40°C), and red LED will glow when temperature is above the pre-defined limit along with the voice alert.

Note. You can replace the voice alert's audio (tempSafe.mp3 and tempWar.mp3) with any other alert audio you want, but make sure the format, that is, .mp3, is the same.

In case you want to change the temperature limit above which you want the alert, you can change it from `if (convertedData > 40)` in Processing source code. **EFY**
