

Low Power Meets Long Range with LoRa Technology

Start Your Next LoRa Project with the Lowest-Power SAM R34 SiP Devices

Accelerate your next design with our new highly integrated LoRa System-in-Package (SiP) family of devices. These new devices feature an ultra-low-power 32-bit microcontroller (MCU), sub-GHz RF LoRa transceiver and software stack, which makes them ideal for a broad array of long-range, low-power IoT applications that require small form factor designs and multiple years of battery life.

With this new family of devices you can get your next design up and running easily by combining your application code with our LoRaWAN™ stack. You'll also begin prototyping quickly with the ATSAMR34-XPRO Development Board, which is supported by the Atmel Studio 7 Software Development Kit (SDK). This development board is certified by the Federal Communications Commission (FCC), Industry Canada (IC) and Radio Equipment Directive (RED) and the SAM R34 SiP devices support worldwide LoRaWAN operation from 862 to 1020 MHz, allowing you to use this single-part variant across many geographies.

Key Features

- Industry's lowest-power LoRa technology SiP
- Proven LoRaWAN software stack
- Small form factor
