

Can There Be A World Without Farmers?

Agriculture is one of the world's major industries and is indispensable to food security. The world without farmers and agriculture would be a nightmare for the modern world and civilisation. Artificial intelligence (AI) holds the promise of driving the agricultural revolution to produce more food using fewer resources

Have you ever thought of a world without farmers and agriculture? If that would be the case, most of us would go hungry, homeless, naked or more. And we would probably be hunters or food gatherers, and would not be reading this article.

The most mysterious and intriguing Mayan people of the ancient and highly advanced civilisation, who developed the solar calendar and the complex astronomi-

cal system, disappeared without a trace. Some historians and archaeologists believe that one of the reasons behind their disappearance could be drought and scarcity of food in the area during their time.

Without agriculture, we would starve and the modern civilisation would come to a stop. Therefore sustainable agriculture, climate-smart agriculture, modern genetics and improved farming methods, among others, are needed to ensure global food security.
