Hardware and firmware

192.168.1.133, and is connected to the intermediate PC that reads data from the MCU and publishes it on the cloud using Python program.

You may also refer to ‘RPC over HTTP’ section on the page <https://developer.mbed.com/cookbook/Interfacing-Using-RPC> for more details on building a device firmware over Ethernet.

To check PC connectivity with the MCU via Eth-

This URL will be different in your case; change `http://192.168.1.133/` defined in the code, accordingly.

Firmware. Mbed is an IoT platform for Internet-connected devices based on 32-bit ARM Cortex-M MCUs. Applications can be developed using the free Mbed online IDE, an online code editor and compiler. Since the Mbed project is compiled on the cloud, using the built-in C++ compiler, simply a Web browser is needed on the local PC. You can open the compiler from the following link:

The online compiler enables you to either write your code from scratch, or import an existing project and modify it to suit your needs. The only thing you need is an account and login credentials to proceed with project development.

Python programming. To use the

1. Download and install Python 3.7.13 module.

3. To install the library for Windows, enter the following command:
