amount of water that you have used.

One interesting example is Hydrao smart shower, which measures water consumption through an app. You can compare your usage with others in the house via the mobile app. At ₹ 7000, it should not take too long for Hydrao to pay for itself.

No batteries are needed as Hydrao is hydro-powered. It even tells you about the current temperature of the water, so you do not waste too much water waiting for it to heat up. Thus, it automatically cuts down electricity and water bills.

There are other water heads available in the market, such as from WaterHawk and Evolve.

Efforts for conservation of water should not be confined to indoors. For watering your lawn, you could try a smart watering controller, which connects to weather data via cloud and adjusts the sprinkling schedule. Consequently, the sprinkler does not water if it is raining or is about to. It can be controlled via smart home

platforms. You only need to select your watering patterns based on vegetation and yard size and then let the device do its work.

Blossom smart watering controller costs ₹ 6300 for seven zones and ₹ 13,000 for 12 zones. For larger

yards, Rachio smart sprinkler controller connects up to 16 sprinkler zones.

Tips for water conservation

Avoid the use of rinse hold setting on your dishwasher as this uses 11 to 26
