COMPONENTS

LDO regulator

STMicroelectronics LDO40L 400mA low dropout linear regulator delivers quiet and efficient power for always-on automotive modules and noise-sensitive loads. With 45µA quiescent current, the AEC-Q100-qualified LDO40L reduces the demand on vehicle batteries to run loads such as body and interior functions that are active when ignition is off.

In addition, it can be disabled to achieve a very-low shutdown current of only 1µA. Internal circuitry operates from an input voltage as low as 3.5V and combined with extremely low drop-out voltage of 36mV at 100mA load, or 140mV at full load, it enables LDO40L to maintain power to the load as the input dips during cold cranking.

AC/DC converters

Mornsun has launched a new AC/DC converter series LD03-20BxxWG, targeted at smart home white goods. The new series features compact size, high efficiency, high reliability, high cost effectiveness and multiple protections.

Product advantages include:

- Meets latest safety standards and white goods standards (EN/UL62368, EN/UL60335, EN/UL60950, GB4943 safety standards)
- Meets 5000m altitude requirements
- Superior EMC performance

- EMI performance meets CISPR30/EN55032 class B
- Green power
- Standby power consumption as low as 0.2W

Reverse conducting IGBT

Infineon Technologies has introduced TRENCHSTOP feature IGBT protected series for induction heating. Compared to a standard RC-H5 reverse conduction IGBT, this new family integrates logic functionality and a dedicated driver IC for various programmable protection features in a single device. The protected F series guarantees higher system reliability with less design and programming effort for all induction heating applications using a single-ended topology.

MEMS inertial sensors

element14 has expanded its portfolio of inertial sensing solutions with the full range of high-performance micro-electromechanical systems (MEMS) gyros from Tronics Microsystems, a division of TDK, that manufactures standard inertial sensors and custom MEMS products. Tronics high-performance MEMS inertial sensors are ideally suited for system manufacturers with strong requirements for high bias stability and high-performance inertial sensors.

Key applications include precision navigation, motion tracking and control, and optical stabilisation. This comprehensive sensor portfolio brings a tailored solution to support system manufacturer's transition to MEMS products, with huge benefits in terms of size, weight, power and price, with-

out compromising on performance and reliability.

Operational amplifier

Rapid expansion of wireless capabilities, such as Wi-Fi- and Bluetooth-enabled applications, is increasing high-frequency noise in the liveable space and work

environments. To allow designers to provide improved performance while more easily managing an increasingly difficult

environment, Microchip Technology has announced MCP6V51 zero-drift operational amplifier. The new device provides ultra-high precision measurement while minimising the increasing influence of high frequency interference by offering a wide operating range and on-chip electromagnetic interference (EMI) filters.

Magnetic sensor ICs

Allegro MicroSystems has announced the release of its most advanced transmission speed sensor family members, complete with ASIL B certification. The A19520, A19530 and A19570 magnetic sensor ICs measure speed and direction information and integrate electromagnetic compatibility (EMC) protection capacitors.

The sensors also incorporate Allegro's SolidSpeed Digital Architecture, a groundbreaking mixed-signal architecture that enables the widest dynamic range of air gap, distinction of vibration
