

Wearable clothing and accessories

Belty. Belty smartbelt does more than just hold your pants up—it slims or expands to adjust to granular changes to your waistline! The smartbelt comes with vibration functionality, which means that it can nag you if you are at your desk all day, or pester you about your water intake if it thinks you are not hydrated enough. This feature can be calibrated through the companion app, but it even works without a phone.

Never run out of battery with Belty

Belty Power allows you to recharge your phone when you run out of battery. It houses a rechargeable 2000mAh battery, and supports iPhones, Android phones and most devices with USB support. Belty is artisanally made by L'Aiglon, a premiere Parisian leather company founded in 1889.

Commuter Trucker Jacket. Jacquard, a Google technology, and Levi's joined hands to create Commuter Trucker Jacket. With Jacquard, Google and Levi's have produced a conductive yarn that combines thin metallic alloys with yarns that you typically find on clothing. Jacquard technology, which is woven into the sleeve, lets you access your digital world.

Tiny electronics in the flexible snap tag connect the Jacquard Threads in the jacket's cuff to your mobile device. The snap tag lets you know about

incoming information, such as a phone call, by giving you light and haptic feedback. Inspired by a strap that you

Commuter Trucker Jacket links to your mobile device via Bluetooth

would see on a cuff, it looks and feels like it's a part of the jacket. The tag also houses the battery that can last up to two weeks between USB charges.

Gamergirls. Gamergirls, by Phi Illuminated Design, features two identical, feminine dresses. It lets the wearers compete in a video game played on the opposing person's garment. Each garment is overlaid with a detailed track pattern mimicking the familiar arcade-style gaming displays.

This pattern houses more than 400 individually-addressable RGB LED lights. With this Gamification

Gamergirls, making gaming fun and interactive

project, the wearers compete to reach objectives in the game, getting visual feedback from each other's dresses as objectives are reached. Special visuals are displayed when the final objective is obtained, immediately notifying the other participant that she has lost. The game is controlled using a Bluetooth

Low Energy (BLE) wireless phone app.

Nadi X. Nadi X, by Wearable X, has woven-in technology with sensors around the hips, knees and ankles to guide your flow with gentle vibrations for easier yoga. When paired with Nadi X mobile app, visual and audio cues breakdown yoga poses step-by-step with corresponding vibrations directly from the pants.

The smartpants are available in midnight (solid), midnight (with mesh), black/white (with mesh) and navy/gray (with mesh) variants.

This list is just the tip of the iceberg. The technology-fashion-electronics mash-up does not end here. There is a host of wearable products available in the market that combine style with functionality, for all your individual needs.

Nadi X, for the fitness freak

Polar, the GPS sports watch maker, has entered the world of smart clothing with a smart compression shirt that is designed for serious athletes.

French fashion tech company, Spinali, has created connected clothing, including jeans, dresses and swimsuits. Neviano UV Protect swimsuit collection is equipped with a removable medalion-style waterproof sensor that stops you from staying too long in the sun.

Digitsole intelligent sneakers come with auto-tightening, interactive, heating and shock-absorbing features.

Scientists at Ohio State University are working on embroidering electronics directly onto fabrics. This technology, for example, can give you Wi-Fi signals while looking stylish. **EFY**
