

MARKET SURVEY

May 13, 2019, to allow private industrial units and PSUs to self-certify the quality of products that are supplied to Indian Armed Forces. After ensuring the demonstration of the manufacturer's capability of consistently producing defect-free products over a period of time, responsibility of self-certification will be delegated by Department of Defence Production (DDP), government of India.

Presently, except a few vendors, who have earned the self-certification status, all supplies are subjected to quality assurance by Directorate General of Quality Assurance (DGQA), an organisation under Department of Defence Production in the MoD. All items purchased by the defence forces are subject to trials and evaluation. This policy will bring a major change in the process, as it says, "In light of the government reiterating self-reliance in the manufacture of defence products, the self-certification scheme assumes greater significance."

Moving forward

To ensure the Indian industry makes full use of this opportunity and creates world-class companies and capabilities that address not only India's opportunities but also integrate into the global value chain of OEMs, there is a concrete need for the government to address some issues. Moreover, following challenges need to be resolved:

- Complex buying process and delay in completion of tendering process
- Inadequate government funding for R&D projects
- Inadequate provision for technical superiority to score over L1
- Absence of a level-playing field for Indian private sector players, especially SMEs with respect to PSUs and overseas vendors
- No self-reliance in critical technologies
- Absence of indigenous product development capacity

Successful resolution of the above-mentioned issues with absorption of transfer of technology for niche equipment, proper understanding of offset obligations and having a methodology to handle the same, understanding and executing international collaborations and international joint venture models along with proper emphasis on IPR and patents will help this sector explore full growth potential.

Also, this is the right time to explore export potential for space technology. India has substantial cost advantage in the global market for these technologies. It is worth mentioning that recently, Bharat Electronics Ltd (BEL), the largest DPSU in the country, has identified space electronics as a growth area. After successfully assembling and building one satellite for ISRO, BEL is now going ahead with building future satellites by partnering with the Indian industry. The company has bought 121,406sqm (30 acres) in Devanahalli, near Bengaluru, to build a separate facility specially to cater to ISRO's satellite needs. **EFY**

Introducing Driver-Less LED Lights

BINAY – Lighting Up The Future

BINAY resolves the problem of LED driver failure by eliminating the LED driver itself, with the use of our revolutionary Driver-Less Microgrid Technology for LED lighting

Key Advantages

- Works on existing cabling/wiring systems; no modification required to existing wiring
- Very low per-light cost at extremely high reliability (up to 300,000 hours MTBF)
- Multiple Redundancy of power to lights
- No maintenance required at LED light location points – any maintenance (if ever needed) at easily accessible ground level locations
- No electrolytic capacitors used in LED lights
- Fire-Safe and Electric Shock-Safe
- Up to 20KV Surge Protection
- Hot-Swappable maintainability
- BINAY AutoLux™ provides easy Daylight Harvesting
- BINAY Lux Degradation Compensator automatically compensates for normal LED light degradation over time
- Up to 95% Efficiency, with no THD or EMI issues in power lines
- Easy Dimming to very low levels (<2%)
- Uninterrupted Light Supply (even in case of power failure)
- Easy, cheap, and efficient upgradation to solar powered operation

Lower Cost

Greater Reliability

Increased Safety

5 Years warranty

Solar Power compatibility

TRIED AND TESTED TECHNOLOGY

Successful operational installations (over the last 10 years) in industrial plants, nuclear facilities, hospitals, 5-star hotels and several other applications

With so many advantages to the BINAY Driver-Less solution, it is costly to NOT implement this technology!

Binay Opto Electronics Pvt. Ltd.

27, Panditji Terrace, Calcutta 700 029, India
