

Alexa to add support for Hindi soon

India is a key growth market for Alexa's global team at Amazon and, witnessing the potential, the team is now working to introduce more regional language capabilities in the voice-based assistant. Right now, Alexa can understand some *Hinglish* commands, but these are few and far between. According to Rohit Prasad, vice president and head scientist for Alexa, for Alexa team, it is a contextual, cultural as well as content-related challenge. Because the question is not whether Alexa can understand Hindi, it also needs to be Indian when it speaks in Hindi as there are several dialects and accents out there that Alexa needs to understand and react accordingly. For example, jokes that are appropriate in the US may not sound appropriate in Indian languages. These are challenges that are not language-dependent but more culture-dependent.

Amazon launches AI-powered fashion search

Amazon.com has introduced StyleSnap, a feature on its app that allows users to upload a picture of a look or style they like and get recommendations for similar items on the platform. When providing recommendations, StyleSnap considers a variety of factors such as brand, price range and customer reviews. Shoppers often struggle to find styles they cannot describe in words. StyleSnap, an artificial intelligence (AI)-powered feature, will help them shop—all they need is a photograph or screenshot of a look that they like.

Google Maps introduces Incognito Mode

During its I/O keynote, the tech giant announced it was bringing Incognito Mode to Maps. Most users will be aware of Google Chrome's Incognito Mode that does not save browsing history, cookies, site data or any information entered into forms. Similarly, Incognito Mode for Google Maps will ensure places users search for will not be linked to their account. The change will surely be incredibly popular with those who are particularly concerned about their privacy when using such a feature. Google will display its signature Incognito logo within Maps when users have activated the feature.

Skype brings screen sharing feature to iOS and Android

Skype is taking one of its most popular desktop features to mobile devices: screen sharing. The company has announced that its mobile screen sharing feature is now out of beta testing, allowing both iOS and Android users to share their phone's screen while on a call. The feature could be used for work-related purposes, like sharing a PowerPoint presentation. But it also could be used for fun, like for online shopping alongside a friend. More practically, it could be used to give remote tech help. To access the option, Skype users will need to tap the newly added "... (more)" menu in the app. This is where they will find other recently launched features as well, including call recording and subtitles.

The prices, features and specifications are based on information provided to us, or as available on various websites and portals. EFY cannot vouch for their accuracy.

"This classroom has a CCTV, digital attendance system, digital board, projector and many other things. Unfortunately for you, it still does not have a digital teacher."

"Of course, I developed rural India! But I promise I will not bring any optical-fibre project to your village to disturb the peace."
