

LARGE-SCALE CONVERGENCE, A 5G Way

Saurabh Verma is founder-director and chief technology consultant, Fundarc Communication (xgnlab)

Large-scale convergence, or LSC, is not just about the convergence of different technologies. It is about developing a comprehensive framework that will enable delivering of services as per the requirement of various applications

5G is about many things. And the intrinsic nature of everything is that there will always be scaling up, whether it is in terms of performance KPIs, uses of spectrum, more technology accommodation, operation, management or orchestration. Everything needs to be scaled up, and this is called large-scale convergence, or LSC.

5G will soon be all about convergence. It will be defined by it and it will define it too, in addition to new dimensions, large abstractions and so on.

Boingo Wireless's chief technology

officer says, "Beware, convergence is the future! Ubiquitous 5G is not economically practical without coexistence between licensed, unlicensed and shared bands. Mobile connectivity is no longer a device; it is a lifestyle. So, we must embrace converged solutions that leverage multiple bands and technologies."

5G is also being seen as the catalyst for Industry 4.0—the fourth industrial revolution—which will essentially set the paradigm of Everywhere and Everything Connectivity. The large-scale phenomena will not appear suddenly. It will take multiple
