

AI IN AUTOMOTIVE

This is regarding “AI in Automotive: The Future is Now” article published in March issue and also available on <https://electronicsforu.com>. Flying and self-driving cars are a dream come true technology for me. AI will completely transform the automotive industry. I am thankful to EFY for publishing such a wonderful and informative article. Keep posting such wonderful articles.

Pawna

EFY. Thanks for the feedback!

ELECTRIC VEHICLE

The “An EV Is About Eight to Ten Times Cheaper As Compared To An IC Car” article published in April issue is interesting!

O. Subrahmanyam

EFY. Thanks for the feedback!

INTERNET TECHNOLOGY

I read “Communication and Internet Technology: How It All Began - Part 1” article published in April issue. It is very interesting and easy to understand. But its second part, published in May issue, is very complicated and not easy to understand. Please simplify the content in future issues.

U.M. Prakash Edison

The author Prof. C.T. Bhunia replies:
Introduction is made with an analogy of natural communication. But when techniques and technology of Internet are illustrated, it cannot be done using analogy of nature. I suggest you read the article slowly and more than once. I have tried my best to present it the simplest possible way.

SENSORS FOR THE IoT

The “Importance of Sensors In the Internet of Things” article published in

February 2018 issue, also available on <https://electronicsforu.com>, is quite good and simple to understand.

Fabio

EFY. Thanks for the feedback!

CONTROL WITH AUTHENTICATION

I am a subscriber to EFY since 2000 and I just constructed “Control with Authentication for Up To Four Devices” DIY project published in April issue.

I was able to get the IP address of NodeMCU module and four devices along with status, which was received on the control console as described in the article. But I was not able to get signal changes at output pins D5, D6, D7 and D8 of NodeMCU. It is showing 0V even when I trigger the respective output from the control console. Please help.

Anukumar Mohan

The author David Hembram replies:
I have tested it again and found that voltage is changing from 0V to 3.3V on pins D5 through D8 of NodeMCU v0.9 module. You might be using a different module. Please check the module by running a simple LED-blink program to test pins D5 through D8.

SPECTROGRAM OF A SPEECH SIGNAL

This is regarding “Understanding Spectrogram of a Speech Signal Using MATLAB” DIY project published in January 2018 issue. How do I calculate MSE and SNR of ECG signal before and after noise? I need the result for about 300 sample frequencies.

Joseph I.K.

The author Jayan A.R. replies:
I suppose the question is about calculation of mean square error (MSE) and signal-to-noise ratio (SNR) of ECG signal.

It is a signal processing problem, and details (like sampling rate) of the signal are needed to answer it. What is meant by 300 sample frequencies is not clear. You may refer to the commands in the signal processing toolbox of MATLAB and use the correct commands.

VIRTUAL TELEPRESENCE

This is regarding “Virtual Telepresence Robot Using Raspberry Pi” DIY project published in March 2018 issue. I am using Xiaomi Redmi Note3 and Raspberry Pi 3 Model B+. Raspberry Pi did not get sensor values from the mobile fast enough to move the servo motor. Actually, Raspberry Pi gets accelerometer and gyroscope values but not data from the magnetometer. Please help.

Rohit Dhunisingani

The author Shamin P Shaji replies:
Xiaomi and other Chinese phones have shown this issue before. With Samsung Galaxy Grand 2 you need only two sensor values. The program is for only decoding these two values.

CERTIFICATE GENERATION

The “Automatic Certificate Generation Using MATLAB” DIY project published in April 2018 issue is an interesting one. Do I need to install Computer Vision System Toolbox with licence? Is it possible to get this toolbox for free, or can it be replaced with a different toolbox?

Mohammed Mumuni

The author Vijaykumar Sajjanar replies:
MATLAB toolboxes are not available for free. But a trial version can be requested, which will be valid for fifteen days. Alternatively, Python can be used to get the same results using Python Imaging Library (PIL) package. I have written Python program for watermarking application for a large set of images. Both Python and its packages are open source.
