

WHY CONVECTION OVEN IS BETTER THAN MICROWAVE AND OTG

Deepshikha Shukla

With microwave technology, it has become extremely easy to take ice-cold food and warm it in a fraction of a minute. Even defrosting meat takes only a few minutes, and you are ready to cook your meal! Microwave and convection ovens both include turntables or mirrored walls to circulate the radiation evenly, effectively cooking the food in its own heat.

A microwave oven utilises microwaves alone for heating the food, so it takes a longer time for the food to be cooked. A convection oven's special feature is a fan that constantly circulates hot air around the food, so it cooks faster and browns evenly than a microwave at a lower temperature.

A convection oven heats the food from the outside to higher temperatures than a microwave oven. While a microwave oven is great for uniform reheating, cooking and defrosting, a convec-

tion microwave is great for grilling, baking, roasting, browning and crisping foods.

A convection oven can perform all the functions of a microwave and has some additional features. A convection oven is more energy-efficient than an oven, toaster and griller (OTG). An OTG can grill, bake and toast but cannot be used to heat and defrost.

Designed for safe and fast cooking

A microwave oven is designed to cook food quickly by heating it from the inside rather than from the outside alone. This, in turn, causes water
