

Optical-Fibre Solutions For FUTURE DATA CENTRES

With continued expansion and growth in the data centre, a well-planned cabling infrastructure is critical for both present and future success. Fundamental concerns that a cabling infrastructure must address are reliability, manageability, scalability and flexibility. A structured cabling system provides a flexible cabling plan to address the commonly-performed tasks of moving, adding or changing the infrastructure as the network grows. A well-planned optical cable infrastructure will have to be operational through several iterations of system equipment solutions and multiple generations of protocol data-rate increases

DEEPSHIKHA SHUKLA

Development in the Internet of Things (IoT) and 5G technologies requires downloading and uploading of data with high Internet speed. To achieve this, we need data centres with high-speed data accessing and saving compatibility. Optical fibres

are opening up new opportunities for designing, managing and operating cloud and on-demand computing resources. These now offer multi-gigabit speeds to any location served by fibre and have opened a great opportunity for data centre location options for enterprises.
