

nology, says, “We are excited about the use of the next-gen Edge computing device running vision AI solutions. This allows us unprecedented technology integration with varied use cases like smart campuses, smart lights, facial recognition and so on. We are also looking to explore further avenues to use the unique technology in the fields of retail and security going forward.”

Shashank Donthi, principal architect - technology development, Hynet-ic, says, “The biggest challenge in the adoption of new technologies is the high cost of development and execu-

tion. By leveraging on each other’s expertise, collaborative growth models help bring costs down and reduce time-to-market of next-generation technology and products.”

Inkers designs and develops deep large-scale AI and machine learning (ML) vision solutions for enterprises, retail, defence and security organisations, public services like smart cities, and industrial workflow automation. It is a vision AI large-scale platform company for core intelligent video analytics (IVA) applications like face recognition, object detection, tracking and visual workflow automation, among others.

Its platform, called InkVision, can run hundred times faster or handle hundred times more cameras than competing solutions while supporting third-party solutions. Inkers currently provides full-stack industry solutions built on InkVision, and has successful deployments in leading institutions and MNCs in India.

The future of streetlighting will utilise AI algorithms to perfectly suit the needs of the modern world. Smart streetlights are great for urban cities, where lighting is an expensive business.

2 Bringing Offline TRUCKING Operations ONLINE

Founded in 2015 by IIT-Kharagpur alumni, BlackBuck is devoted to making it easier for fleet operators to book a load so they can move at capacity, and give shippers of all sizes access to the right truck, at the right time, for the right price—at a click of a button.

India’s logistics market is expected to reach US\$ 215 billion by 2020, led by the ever-expanding Indian economy and the burgeoning e-commerce industry. According to a research report titled “Logistics in India: Challenges and Scope” at <http://globalbizresearch.org>, despite an increase in demand for its services, the logistics sector in India remains bogged down in complexities that have the potential of holding it back. These include significant inefficiencies in transportation, poor condition of storage infrastructure, low rate of technology adoption and poor skills

of logistics professionals.

BlackBuck brings cutting-edge technology to a traditionally low-tech sector. It matches a shipper with a trucker, takes care of information mismatch and clears the way for price discovery, thus achieving optimum efficiency. It also facilitates infrastructure around trucking, including insurance, payments and other financial services.

For shippers. The platform manages shipments on one smart and convenient platform. It helps shippers locate available trucks across the country without needing to make multiple phone calls or monitor shipments at every kilometre. Its machine learning algorithms connect shippers with the most suitable fleet operator depending on source, destination, material to be shipped and other details.

For fleet operators. Using Black-

Buck, fleet operators can find and book daily loads for their fleet with ease, at fair and transparent pricing. They can align the trucks with BlackBuck platform to ensure higher truck utilisation to earn more. An efficient route planning helps them optimise time and reduce fuel expenses of the fleet.

Since its inception in April 2015, BlackBuck has acquired such clients as Britannia Industries, ITC, Asian Paints and Hindustan Unilever. It has more than 250,000 trucks on its platform across India. The company has partnered with the World Bank and the Indian government on key policy initiatives such as Goods & Services Tax (GST), e-way bill and more. It is currently expanding into areas of financial services to promote financial inclusion within the ecosystem.

3 ENERGY MONITORING For Optimising Output

A high natural resource depletion rate and increasing pollution levels are raising concerns, which need immediate atten-

tion. We cannot entirely cut down on our use of non-renewable resources. However, considering these cannot be replenished at the rate these are

consumed—we have a long way to a complete transition to alternative resources of energy—we must minimise wastage of resources and
