

Smart mattress that changes its temperature to wake up the user

Eight Sleeps has launched a bed that learns the perfect temperature for the user's sleep, and dynamically warms or cools according to needs. Called the Pod, this new smart mattress combines dynamic temperature regulation, biometric track-

The Pod adjusts the surface temperature of the bed to wake up the user gradually and naturally, without the sound of an alarm. (Credit: <https://eightsleep.com>)

ing, Alexa integration and sleep coaching. It tracks and learns sleeping habits and then adjusts the bed's temperature for optimal comfort. So, when the user is getting too hot, the Pod will cool the mattress down, and vice versa. Temperature options range from a chilly 12.8°C (55°F) all the way up to 46.1°C (115°F).

The Pod also includes a thermo alarm feature that begins cooling the bed slowly before its set wake-up time to ease the user into the day. It also allows him or her to manually adjust the temperature. The mattress also offers an AI-powered sleep coach that uses biometric tracking to analyse patterns and share insights on overall sleep health. The Pod's smart home capabilities allow it to integrate with other smart home devices, including Amazon Echo, Google Home, Nest and Philips Hue.

A pen that can wash clothes in 30 seconds

ViTUN2.0 ultrasonic cleaning pen is a stylish and compact device that can easily wash away stains, in addition to saving time, water and energy. It uses powerful ultrasonic energy that can instantly remove dirt and stains at a microscopic level.

ViTUN2.0 ultrasonic cleaning pen

The device allows users to easily deal with all kinds of stains anytime, anywhere, including coffee, jam, salad, blood, lipstick and so on. It can also wash things like glasses, sports shoes, razors and the like. ViTUN2.0 takes only 30 seconds to wash away the stains.

According to *Digital Journal*, the R&D team behind ViTUN2.0 is developing laundry equipment with higher efficiency so that users can wash clothes without using water in future.

Frankfurt airport working on flying taxis

The operator of Frankfurt's international airport says it is developing a concept for electric air taxi services. Fraport AG is working with Volocopter GmbH, which makes two-seat, multi-rotor electric aircraft that can fly with a pilot or autonomously.

The multi-rotor electric aircraft Volocopter 2x

However, operating such taxis to bring people to and from the airport will have to wait until the legal framework for autonomous flying is established and such aircraft can be certified for passenger use. Volocopter says its aircraft, based on drone technology and flight tested in Dubai, are quiet, safe and local emissions-free. The idea ultimately would be to operate pilotless when the legal framework is in place, according to *New York Post*.

The European Aviation Safety Agency says it is developing standards to enable certification of such aircraft.
