

alisation is causing high population density without significant infrastructural development of the suburbs. Mega cities, such as New Delhi and Mumbai, are affected the most. Use of multimodal transportation systems, including bicycles, motorcycles, auto rickshaws, cars, buses, metro, trains and pedestrians, are leading to rapid increase in road traffic.

This ever-increasing traffic flow leads to traffic congestions and jams, giving rise to increase in the cost of transportation as well as affecting the routine lives of people. It is causing several problems such as wastage of fuel and time, increasing environmental pollution, accidents and cases of road rage.

There are several other reasons causing this sudden surge in road traffic, including rise in population (leading to an increase in the number of vehicles on road), insufficient road capacity, traffic control lights (that are not as per traffic density), non-availability of complete and timely information regarding traffic density on different routes, inefficient transport management and unrestrained demand for vehicles. Given this situation, the very nature of traffic makes it difficult to estimate the road traffic

density on real-time basis, so as to make better traffic-related decisions and manage the traffic efficiently.

As a result, cities are unable to cope up with these problems. While the emphasis is on building roads, bridges and underpasses, and creating alternative modes of mass public transport systems, this is not sufficient to address traffic congestion and management, which continues to become more difficult with every passing day. Hence, there is an urgent need for introducing a modern system for resolving these issues.

The solution lies in leveraging advanced technologies and intelligent solutions by deploying ITMS. This system would be able to track the flow and pace of traffic to provide real-time traffic management, which is more dynamic and accommodative of the varying nature of traffic density.

Technologies used for ITMS

A number of technologies, described below, are integrated to build ITMS. The technologies need to be chosen depending on use, location and finances available. Advances in the field of telecommunications and information technology coupled with availability of ultramodern and state-

of-the-art microchips, radio frequency identification (RFID) and inexpensive intelligent beacon-sensing technologies are helping enhance the technical capabilities of these systems.

Communication technologies. Among the wireless communication technologies used for ITMS, radio communication using UHF and VHF are the most popular ones for short-range communication.

Longer-range communications use infrastructure networks such as Worldwide Interoperability for Microwave Access (WiMAX), Global

DIGITAL MULTIMETERS

801 JUNIOR

603 JUNIOR

HOLSTER WITH
MAGNET

TORCH LIGHT

TEST LEAD
GRIPPER

- 3½ Digit 6000 Counts (801 JUNIOR)
- 3½ Digit 1999 Counts (603 JUNIOR)
- LCD with Backlight
- TRMS Auto Ranging (801 JUNIOR)
- Manual Ranging (603 JUNIOR)
- Upto 1000V DC
- Upto 750V AC (TRMS in 801 JUNIOR)
- Upto 10A DC / AC (TRMS in 801 JUNIOR)
- 600Ω ~ 60MΩ (801 JUNIOR)
- 200Ω ~ 20MΩ (603 JUNIOR)
- Transistor Test [hFE] (603 JUNIOR)
- 60.00nF ~ 100.0mF (801 JUNIOR)
- 60.00Hz ~ 10.00MHz (801 JUNIOR)
- 1% ~ 99% Duty Cycle (801 JUNIOR)
- -20°C ~ 1000°C [-4°F ~ 1832°F] (801 JUNIOR)
- Data Hold, APO, NCV (Buzzer & RED LED), Diode Test (801 JUNIOR), Continuity Test (Buzzer & Red LED), Holster with Magnet, Torch Light, Test Lead Gripper

Meco Meters Private Limited

Plot No. EL-60, MIDC Electronic Zone,
TTC Industrial Area, Mahape,
Navi Mumbai - 400710 (INDIA)
