

Connecting NodeMCU with IoT platform

<https://electronicsforu.com/electronics-projects/smallest-iot-home-automation-esp8266-01>

6. Connect NodeMCU via USB cable

Connect the water heater to 230V AC mains at connector CON1 through normally-connect (NC) contact of RL1. Connect 230V AC mains to CON2. When you click on Play in Blynk app, the timer will start. When the timer reaches the pre-determined or set time, as defined in the app, it will automatically start. The relay will get energised, and the heater will be switched on. And after the stop time, the relay will get de-energised and the heater will be switched off. Now, the project is ready to use. **EFY**
