

NEW CHIPS On The Block Making SoCs Outdated

Recent entry of the network-on-chip (NoC) is likely to make system-on-chip (SoC) outdated soon. The new advanced NoC microprocessors can provide better AI integration with low power consumption. Several companies have already started offering NoCs

Vinayak Ramachandra Adkoli is BE in industrial production. He was lecturer in mechanical department for 10 years in three different polytechnics. Now, he is a freelance writer and cartoonist

Microprocessor technology needs to be more advanced than the devices it is currently being employed in. As a result, nanotechnology needs more advancements to increase the capability of microprocessors. It is time for designers to focus on embedding more capabilities into processors with the same or even smaller size.

Over the past few years, we have observed numerous new types of microprocessors being proposed by different

research institutes. However, no one is sure about how long it would take to get these new technologies into commercial form. Hence, there is no point in waiting for them at this point of time.

To increase the capability of your micro device, one option is to use a system-on-chip (SoC). For example, MediaTek recently launched HelioP70 SoC with an artificial intelligence (AI) engine combined with CPU and GPU. It can be effectively used for advanced AI processing. HelioP70
