

Government portal to help users find lost or stolen cellphones

The Central government has launched a portal that will help users find their lost or stolen cellphones. Each cellphone has a fifteen-digit unique identification number—International Mobile Equipment Identity (IMEI) number. Whenever a user makes a call, the call record shows phone number of the caller and IMEI number of the handset from which the call has been made. If the phone has been stolen or lost, the user has to lodge an FIR and inform Department of Telecom (DoT) via helpline number 14422. DoT will block the reported lost/stolen phone across the network, which will prevent reuse of the phone. If anyone tries to use the same device, the telecom service provider will identify the new user, and provide information to police to trace the lost/stolen cellphone. All major service providers—BSNL, Reliance Jio, Airtel, Vodafone and Idea—will help DoT to track the phone.

FoodTracker, an AI-powered food detection app

A research team at McGill University in Canada has developed a mobile app that can recognise food items inside an overall meal in real time, providing useful nutrition-related information. The new mobile app, called FoodTracker, is easy to use. When a user points the smartphone camera to a plate containing his or her meal, the app rapidly recognises its different ingredients.

Smartphone app that can help parents detect early signs of eye disorders in children

A Baylor University researcher's prototype smartphone app, designed to help parents detect early signs of various eye diseases in their children such as retinoblastoma, an aggressive pediatric eye cancer, has passed its first big test. CRADLE (ComputeR Assisted Detector LEukocoria) app searches for traces of abnormal reflections from the retina called leukocoria or white eye, a primary symptom of retinoblastoma, as well as other common eye disorders. It is an effective tool to augment clinical leukocoria screenings, allowing parents to efficiently and effectively screen their children more often throughout their development.

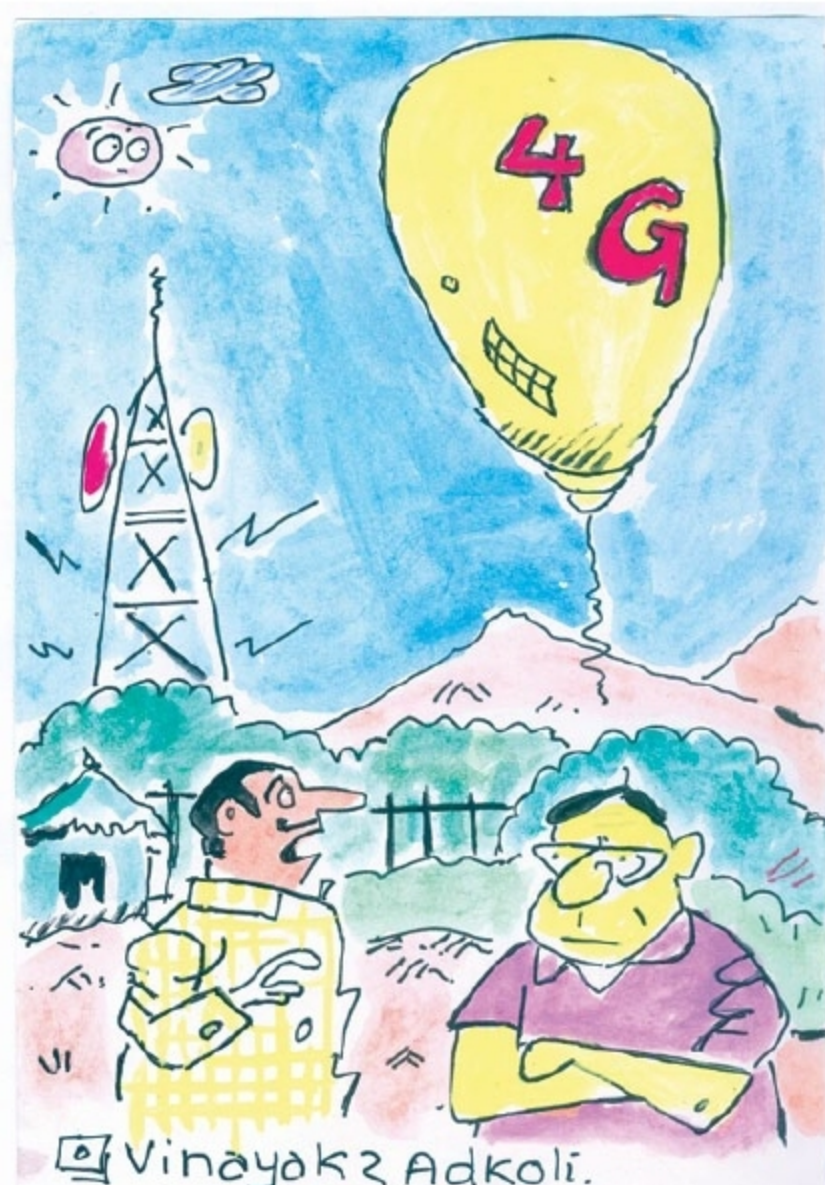

A camera app with a focus on 3D content

LucidPix allows users to create 3D photos that really pop. Anyone with a smartphone can capture immersive pictures, add fun frames, and share on social media or directly with friends. The app uses artificial intelligence (AI) technology that processes depth like the human brain without the need of moving the phone, looping the video or limiting users to a set of devices. No special glasses, headsets or a 3D screen are needed either.

The prices, features and specifications are based on information provided to us, or as available on various websites and portals. EFY cannot vouch for their accuracy.

"The biggest challenge for our country is to become a space superpower, but unfortunately, it is becoming an e-waste superpower."

"Our village is very romantic. This balloon cell tower has become a famous tourist attraction in this hilly area."
