

How 5G And LTE IoT Can Revolutionise Industrial Internet Of Things

This article has been curated based on a speech given by Uday Dodla, director - product marketing, Qualcomm India, at IOTSHOW.IN 2019, held in Bengaluru. Dodla discusses Long Term Evolution Internet of Things (LTE IoT), how useful it is and how 5G can power the Industrial IoT (IIoT) in the near future

Uday Dodla is director - product marketing at Qualcomm India

When we talk about the use-cases for the Internet of Things (IoT), we talk about the many connected devices in smart cities, mobile health, utilities, the Industrial IoT (IIoT), digital retail and so on.

According to research, in a couple of years, there will be six billion connected IoT devices. Tens of billions of these devices connecting ubiquitously would mean that the network must be able to handle

these connections more efficiently as well as conserve battery life. A wide variety of applications and devices would also require different types of connectivity technologies. This means there is no one size that fits all. Not everything can connect over cellular networks or Wi-Fi. Hence, it will be a mix of Bluetooth Low Energy (BLE), low-power WAN (LPWAN) and Wi-Fi.

Some of these applications are also asymmetric, which means, for example, a
