position and location of drones in relation to the pilot. These record the home point for Return To Home safety feature in drones.

Most of the latest drones have three types of Return to Home options. First is initiated by the pilot by pressing a button on the remote controller

or in an app. Second is initiated by the drone due to low battery level, where the UAV will fly back automatically to home point. The third is due to loss of transmission between the UAV and remote controller.

Lidar, multispectral and photogrammetry sensors are being used

to build 3D models of buildings and landscapes. Low-light night vision and thermal vision sensors are being used on drones to scan buildings and landscapes to assist in agriculture, firefighting and SAR. The software intelligently combines data from several different sensors such as a thermal camera and a regular RGB camera for the purpose of improving application or system performance of drones. This helps calculate accurate position and orientation information.

Real-time flight parameters

Nearly all drones have a ground station controller (GSC) or a smartphone app, allowing users to keep track of the drones' current flight telemetry. This is also called First Person View (FPV). Some drones include No Fly Zone feature to increase flight safety and prevent accidental flights in restricted areas. This No Fly Zone can be updated or changed by manufacturers from time to time using firmware updates. Sometimes drones find locations from at least six GPS satellites.

Pulsonix PCB Design Software

PCB design done right

Advanced PCB Design Features

- Co-design in integrated PCB / 3D environment
- Import designs from your existing CAD tool
- High Speed design with Constraint Manager
- Free access to over 15 million library parts
- Industry standard manufacturing outputs
- Reverse Engineer from Gerber files to PCB
- Free one-day training on Pulsonix

Maximum Productivity in Minimal Time

With a modern, easy-to-use interface and advanced capabilities to automate your layout process, Pulsonix can be the key to a critical reduction in your design time. That's PCB design done right!
