

YOUR HOME CAN NOW BE COMPLETELY SMART AND CONNECTED!

Nijhum Rudra

The popularity of and demand for Internet services technology has made our lives easier and hassle-free. These days, most household products are Internet of Things (IoT)-enabled, thereby helping us control things from any corner of the room. For instance, we do not need to switch off the TV or microwave oven from its main switch; instead we can simply ask the smart switch to turn it off, or we can do the needful through a virtual assistant-enabled smart speaker such as Amazon Alexa, Google Home and Apple's Siri.

Products in our homes are

getting connected to each other and therefore smart home technologies are gaining huge popularity throughout the world. A smart home is nothing but an amalgamation of enhanced services and top-notch technologies via a network to ensure a better way of living, which also offers ease and convenience to daily routines in the home. Smart home might be new for many people, but basically it only utilises a number of current technologies. Wireless, Bluetooth, DSL, cable broadband and other technologies offer a home network for electronic devices to communicate with each other as well as the Internet.

Due to procrastination, forgetfulness or other reasons, we often switch the lights or water pump on and forget to switch them off. Smart home devices help reduce electricity and water bills by turning these devices/appliances off via mobile apps or smart switches even

when we are asleep or occupied with other work.

According to smart home users, the technology makes everyday life trouble-free as users can carry out almost all household activities via apps even while sitting peacefully on the bed.

Smart home devices have become more advanced than ever, and have also made bedrooms smarter apart from kitchens and living rooms. We give you an idea of the technologies that have made home devices connected to each other.

Smart cooking

Cooking in the kitchen has become smarter, too—this is augmenting every month. Although smart devices cannot cook for us, these can surely help us with a lot of prep along with taking care of the appliances.
